# THE VEIL OF ISIS.

BY THE SAME AUTHOR.

## THE INTELLECTUALISM OF LOCKE.

The following are EXTRACTS from Critical Notices of DR. WEBB'S Work :—

In the spirit of an earnest vindicator of the truth, Mr. Webb undertakes to show that Locke was an Intellectualist, in the sense of Reid and of Kant. His treatise is distinguished by a clear methodical arrangement, by a perfect mastery over his details, and by a style and language unusually perspicuous and precise. Courageously, but without presumption, he assails some of the highest modern authorities in philosophy; and while he always preserves the calmness of temper proper for an undertaking really arduous, he is evidently warmed by a feeling of almost personal regard towards the ill-requited benefactor of English philosophy.

. . . We should gladly have made some extracts, had space permitted, from the very able chapter in which Locke, Hume, and Kant are compared. As far as we know, this is Mr. Webb's first appearance as an author before the general public. He must, of course, expect some controversy. But he has not ventured into the arena without preparation. He need not fear that he will be driven from it ingloriously; and judging from his present work, we may predict for

him, if he will persevere, a career second to no living British metaphysician.—*Saturday Review*.

Mr. Webb's must henceforth be considered the work on this subject. It is not only conclusive, but exhaustive. And yet its arrangement is so admirably logical and consecutive, that the whole is brought within a very limited compass. The author never winds towards his conclusions, or returns upon his path. The Essay is most happily free from digression or repetition. Let us add, that the style, the allusions, and the illustrations, show thorough scholarship, and that classical perfection of training and taste in the use of language, which is rarer still than scholarship.—*London Review*.

We can assure our readers that The Intellectualism of Locke is really a great essay, written by a man of no ordinary grasp of mind, and capable of putting abstract thoughts before the student in eloquent and attractive language.—*Christian Examiner*.

A book distinguished in no ordinary degree by sagacity and learning.—*Critic*,

## P R E F A C E .

---

ACCORDING\* to a French writer, quoted by Dugald Stewart in his *Dissertation*, the comparative history of philosophical systems is nothing else than a history of the variations of philosophical schools, leaving no other impression upon the reader than an insurmountable disgust at all philosophical researches, and a demonstrated conviction of the impossibility of raising an edifice on a soil so void of consistency as that which philosophy supplies.

I have long come to the conclusion that the general conviction to which this passage gives expression is erroneous, and that even the extent of the variations of opinion on philosophical questions has been greatly exaggerated by those who have written on the subject. It cannot be doubted, as David Hume observes, that the mind is endowed with several powers and faculties, that these powers are distinct from each other, that what is really distinct to the immediate perception may be distinguished by reflection, and consequently that there is a truth or falsehood in all propositions on this subject which

are not beyond the compass of our understanding. If this be so, there is no reason why philosophers should not arrive at a practical agreement on such questions as the origin of our knowledge and ideas, the classification of our mental faculties, the nature of general reasoning and of reasoning by induction—in short on all the questions which the term psychology embraces. These are mere questions of fact; and on all these points we are capable of knowledge—of knowledge similar in character and certainty to that which we attain in the study of the phenomena of external nature, supposing what we call external nature to exist externally, and not to be itself a mere evolution of the mind.

In point of fact, there is a much more extensive agreement among philosophers upon these interesting questions than is generally suspected. Their actual agreement is disguised by a variety of causes. In philosophy, as in political economy, there are innumerable speculators, who have set up trade, as it were, without any of that intellectual capital which is found in the accumulated thought of their predecessors, and whose divergences, for that reason, may safely be discounted. Of those who have endeavoured to prepare themselves for their vocation by a previous course of reading, a large number have studied the former philosophers in histories of philosophy, themselves compiled from previous histories, which are not histories but misconceptions. Even when great thinkers, like Hobbes, and Locke, and Hume, are studied in their own writings, those writings contain so much equivocal

## *Preface.*

expression, so much misleading metaphor, so many perfect statements, so many statements apparently conflicting, so many statements in which precision is sacrificed to point, that the real meaning of the author, like a seed of nature lying latent in a chaos of phenomena, is to be elicited by a process of patient induction, to the drudgery of which ambitious spirits are unable to submit. The sense of originality, the reaction against assent, and the pride of confutation supervene, and thus impede the highest intelligences are apt to fancy themselves opposed to those with whom, if they properly understood them, they would find that they agreed. The conditions of all philosophical discussion are calculated to aggravate the evil. There is no universal language of philosophy, and to such an extent has mere difference of expression been mistaken for diversity of thought, that the history of philosophy appears to the cynical spectator to be a wild Babel of confusion. Even when a philosopher, like Kant, invents a terminology which is generally adopted, the very novelty of his expression disguises the identity of his thoughts with those which had previously expressed in more familiar language. Another source of illusion—though even this does not exhaust the tale—requires to be stated. Truth, as I have elsewhere said, is a polygon and not a point; but before the polygon is constructed the sides must be described, and, under the influence of natural prejudice, the philosopher who insists on one aspect of a general question is supposed to ignore the existence or to deny the importance of the rest.

Impressed with these considerations, some years ago I wrote and published the *Intellectualism of Locke* with the object of indicating the fundamental identity of opinion, as far as mere matters of psychology are concerned, which exists between Locke on the one hand and Reid and Kant upon the other. In the present work I have followed out this idea, and have attempted to show that on the great question of the theory of perception Hume is substantially at one with Reid, and that on the still greater question of the transcendental origin of our ideas of physical causation he anticipated both the principle and the results of Kant.

As to those matters which transcend the sphere of consciousness, and which concern, to use the familiar phrase, the mystery of existence, the demonstrated conviction of hopeless disagreement displays a show of reason. But even here there is a tendency towards unanimity among those who are competent to form an opinion on the subject. On the question of the existence of an external world, to take the simplest question of existence, the great thinkers, who have formed an epoch in the history of thought during the last century and a-half, have come to a practical agreement. Berkeley started the question by asking how it is possible for us to know that material substances exist; and having shown that we cannot know this either by sense or reason, declined to believe in the existence of that of which he had no knowledge. Hume, less sceptical than the dogmatic theologian, admitted that the existence of material things must be assumed as a fact in all our reasonings,

but contended that if the existence of an external world be based on instinct it is contrary to reason, and that, if referred to reason, it is unsupported by any evidence that reason can accept. Generalized by Kant, the conclusion of Hume assumed a more scientific form, and among the philosophers of the present day there are few who would venture to reject the critical conclusions—that no object external to ourselves is presented to our consciousness; that if an object be not given, its existence cannot possibly be proved; and that if it cannot be proved, its existence must remain for ever a mere object of belief.

Whether the existence of the great realities with which we are concerned is to be regarded as an object of knowledge or as an object of belief is a matter of small practical importance to those who reflect that in the ordinary affairs of life, as in the deepest mysteries of religion, we live by faith and not by sight. But speculative curiosity remains unsatisfied, and where the field of knowledge is closed, the region of hypothesis expands before us. Are the objects of our knowledge distinct from the subject which evolves them? Are those objects three, or two, or one? Is the Deity, for example, to be excluded from the theory of real existence? Is the world, on the other hand, to be regarded as nothing but a phantasm? Is there no real existence to be recognized except the soul? And as to the soul itself, is it anything but a system of vanishing ideas? Is there any substance in existence? The answer involved in each of these questions is a system of metaphysics. But these metaphysical hypotheses, unlike

the hypotheses which we form as to physical phenomena, are incapable of verification, and accordingly all thinking men are disposed to agree that mere ontologies are not answers to a question of ascertainable fact, but answers to a riddle which in our present state of existence cannot by possibility be solved.

Yet even here, as it seems to me, we have an element of science. Dugald Stewart has observed that from the limited number of good stories, as they are called, which we possess, the wit of man would seem to be a barrel-organ with only a limited number of tunes. This remark applies with more felicity to metaphysics. In India, in Greece, in Egypt, in Mediæval Europe, in Modern Germany, in England, and in France, we see the constant recurrence of those various guesses at the riddle of existence which are called systems of metaphysical philosophy. They are all based on a limited number of fundamental conceptions, the permutations and combinations of which may be rigorously ascertained. To the curious mind it cannot but be an object of interest to contemplate the sum total of the hypotheses which the human mind is competent to frame on a question which it is incompetent to solve. To know the possibilities of thought is knowledge. It is not by a history of names, however, but by an evolution of conceptions, that such a result is to be attained, and, as an illustration of an idea rather than as the accomplishment of an aim, I have sketched the *Ideal of Systems* which concludes these Essays.

One word may be permitted as to the title of this

book. The Veiled Isis, as we learn from Plutarch, was the Egyptian symbol of the mystery of being. I have endeavoured to illustrate the impossibility of solving this mystery, even in its simplest form, by giving a sketch of the speculations in relation to the external world which have occupied thoughtful men for the last century and a-half. In this attempt I have endeavoured to trace the forms which idealism has assumed in the hands of the great masters of speculation; and I trust I may be pardoned if, instead of styling a work composed amid infinite distractions a History of Philosophy from Locke to Hegel, I revive an old fashion, and adopt, though at an immeasurable distance, the precedents set by the *Siris* of Berkeley and the *Leviathan* of Hobbes.

POURTANT pouvons nous dire, que le désir d'entendre la vérité est un désir de la divinité, mesmement la vérité de la nature des dieux, dont l'estude et le prochas de telle science est comme une profession et entrée de religion, et œuvre plus sainte que n'est point le veu et l'obligation de chasteté, ny de la garde et closture d'aucun temple : et si est davantage très agréable à la déesse que tu sers, attendu qu'elle est très sage et très sçavante, ainsi comme la derivation mesme de son nom nous le donne à cognoistre, que le sçavoir et la science luy appartient plus qu'à nul autre, car c'est un mot grec que *ISIS*.

Et en la ville de Sais l'image de Pallas, qu'ils estiment estre Isis, avait une telle inscription :—JE SUIS TOUT CE QUI A ESTÉ, QUI EST, ET QUI SERA JAMAIS, ET N'Y A ENCORE EU HOMME MORTEL QUI M'AIT DESCOUVERTE DE MON VOILE.

THEISTIC IDEALISM:

OR

BERKELEY.

# THEISTIC IDEALISM;

OR,

BERKELEY.\*

---

*Visa quaedam mitti a Deo velut ea quae in somnis videantur.*

CIC. ACAD. ii. 15.

IRELAND may claim the distinction of having produced three philosophers, each of whom formed an epoch in the history of thought. Johannes Scotus Erigena, the founder of the Scholastic System—Hutcheson, the father of the modern School of Speculative Philosophy in Scotland—and Berkeley, the first who explicitly maintained a Theory of Absolute Idealism—were all men of Irish birth, and were marked, in a greater or less degree, by the peculiar characteristics of Irish genius.

It has frequently been observed that the genius of the Irish People is naturally borne to dialectics.

\* The substance of this Essay was originally given as a lecture from the Chair of Moral Philosophy, and was afterwards published as an article in the *North British Review* for May, 1861.

The author of *Hudibras*, indeed, selects 'the wild Irish' as the types of that mystic learning and occult philosophy which he ridicules in *Ralpho*. Nor was this the mere fancy of the poet. As early as the time of Charles the Bold, the contemporary chronicler speaks of the multitude of philosophers who, like Scotus, crossed the sea from Ireland. At a later period Bayle speaks of the Hibernians as renowned for able logicians and metaphysicians; and Stewart describes them as distinguished in all the Continental Universities for their proficiency in the scholastic logic. And the facts justify the statement. It was to the uncouth 'Hibernian figures' who prowled about the halls of Oviedo that Lesage describes *Gil Blas* as addressing himself when bent on disputation. It is an Irish tutor whom Bayle selects as the man to harass a Professor of Salamanca with sorites. It was the Irish at the University of Paris whom Remi describes as 'rampant with reason and on fancies fed.' The Irish logician, in fact, was as ubiquitous as the Irish soldier of fortune, and like the philosophic vagabond in the *Vicar of Wakefield*—nay, if we are to believe Boswell, like Goldsmith himself—he disputed his way through the Universities of Europe.

The University of Dublin has from the first accommodated itself to the national bent, and given a prominent place in its curriculum to mental science. Its statutes, drawn by Laud, enact that the *Isagoge* of Porphyry and the *Organon*, the *Physics*, and the *Metaphysics* of Aristotle, should

be the text-books of the different classes, and that thrice in the week, at least, their topics should be discussed in public disputation. Aristotle and Porphyry in due time were superseded by Locke; and when the heads of houses were conspiring to ignore the existence of the *Essay* at Oxford, and when it merely supplied an occasional thesis at Cambridge, it was the recognized text-book of the schools at Dublin. Nor have the graduates of the Irish University been undistinguished in the prosecution of the favourite study. Dodwell, the antagonist of Clarke—Browne, the most original and independent of the followers of Locke—and Berkeley, the forerunner of Hume and Kant—were Fellows of Trinity College.\* King, the author of the *Treatise on the Origin of Evil*—Burke, among his other claims to distinction, the writer of the *Essay on the Sublime and Beautiful*—and Archer Butler, the historian of *Ancient Philosophy*—were Scholars of the House. To the present day philosophy still occupies its place of honour, and, without mentioning less celebrated names, it is sufficient to point to the historian of the *Rise and Influence of the Spirit of Rationalism in Europe*, as a proof that the philosophic spirit is not extinct in the University of Berkeley.

\* Lord Macaulay, in his *History of England* (ch. xiv.), states, that Dodwell was attainted 'by the Popish Parliament in Dublin,' for the 'unpardonable crime of having a small estate in Mayo.' There was a more obvious ground for his attainder. Dod-

well was a Fellow of Trinity College, Dublin, though Lord Macaulay seems only to have known him as 'Camdenian Professor of Ancient History at *Oxford*.' But even the remains of Berkeley lie at Oxford, and not at Dublin or at Cloyne.

The estimation in which the character of the illustrious Idealist was held by his contemporaries is well known. Everyone knows how he charmed the fierce misanthropy of Swift—how Pope attributed to him the possession of every virtue under heaven—how Atterbury exclaimed, that till he knew him he did not think that so much understanding, so much knowledge, so much innocence, and such humility, had been the portion of any but the angels. The range of his intellectual accomplishments was almost as wonderful as his virtue was unique. He was an accomplished musician; he was a connoisseur in painting; he was a devoted student of poetry and romance; he was the master of an eloquence which could rouse even the Scriblerus Club into momentary enthusiasm for the mission to Bermuda. At the age of twenty-six, he had already produced the works which were to revolutionise the philosophy of Europe. But the *New Theory of Vision*, and the *Principles of Human Knowledge*, and the *Dialogues* by which they were elucidated, were not the only labours of his life. His *Querist*, to repeat the oft-repeated words of Mackintosh, contains more hints, then original, and still unapplied in legislation and political economy, than are to be found in any equal space. In his *Analyst* he anticipated Hegel in pointing out that seeming inconsistency in the calculus of Newton which Carnot attempted to explain by a compensation of errors, which Lagrange endeavoured to evade by his calculus of functions, and which Euler and

D'Alembert could only obviate by pointing out the constant conformity of the mathematical conception with ascertained results. In his *Minute Philosopher* he shows himself master of the whole domain of speculation, and, while tracking the free thought of the day through its various evolutions, exhibits an exquisite elegance of diction which is unsurpassed by Addison himself; and finally, in that wonderful miscellany of physical hypothesis and metaphysical research, which he denominated *Siris*, he seems to have been borne aloft into the very atmosphere of Plato, and has given to the world of speculation a modern counterpart of the Parmenides and the Timæus.

The Theory of Vision which established that 'all *visible* things are equally in the mind, and take up no part of the external space' (s. cxi), was the natural prelude to the Principles of Human Knowledge which proclaimed that "all the choir of heaven and furniture of earth—in a word, all those bodies which compose the mighty frame of the world, have not any subsistence without a mind" (*Prin.* vi. xlv). The conception indeed was no novelty in the history of thought. It had been realized in the prophetic trances of the Hebrew seers, and in the apocalyptic vision of St. John. The Hindoo sages had maintained that our system of perception was a mere picture, and that the world of matter was nothing but *maya*, or illusion. The Philosophers of the West had long been wavering over a similar conclusion. The Platonists had

held that matter was merely a supposition necessary for the production of the phenomena of sense. The Academics had suggested that the perception of external things might possibly be nothing but a dream presented by the gods. The Alexandrines had intimated that the soul was not in the world, but that the world was in the soul. The speculation at an early period engaged the attention of the Church. The Fathers had been compelled to consider the question in the discussion of Marcion's doctrine of the mere phenomenal nature of the Incarnation. The Schoolmen had asked whether God could not present to sense the species representing an external world, when there was in reality no external world for the species to represent. The founders of the more modern Schools of philosophy had been hovering around the same attractive light. Malebranche had admitted that if God should annihilate the material world, and present corresponding ideas to the mind, the phenomena of sense would be the same. Locke had allowed that the idea might exist, though the reality had no existence. Even Leibnitz, in spite of his *Monadology*, had confessed, not only that the existence of body was not susceptible of demonstration, but that the world, for aught that philosophy could teach, might be merely a resplendent iris, an image on the glass, a waking dream.

| A pure Theistic Idealism, it is true, could not well have been developed in the West before the time of Berkeley, for the Pagan Idealists had no

abiding conception of the omnipresence and spirituality of God, and the Catholic philosophers not only accepted the Catholic doctrine of Transubstantiation, but conceived that the existence of the world of matter had been positively revealed by Holy Writ. However this may be, Idealism was the natural product of the age, and of this the history of philosophy affords a curious proof. Three years after the publication of the *Principles of Human Knowledge*, another thinker combined the idealistic elements with which the speculations of the times were fraught. In his *Clavis Universalis*, Collier, like Berkeley, attempted a demonstration of the non-existence of the world; and the perfect correspondence between the independent speculations of the two idealists is one of the most curious facts in the history of thought. It was the correspondence of the clocks of Leibnitz. Collier, like Berkeley, declined to allow the question to be decided by an appeal to Holy Writ with Malebranche, or by an appeal to common sense with Locke. Like Berkeley, he started from the phenomena of vision, and proved that the world of vision could have no existence but in mind. Like Berkeley, he transferred his idealism from the realm of vision to the realm of touch. Like Berkeley, he held not only the non-existence, but the impossibility of the existence, of a world of matter. As to the mode of the production of our ideas, the two philosophers were equally agreed. Both rejected the doctrine of material efflux, and the cognate doctrine of impressed species; both

rejected the hypothesis of seeing all things in God, and also the egoistical idealism which declares that the mind is the creator of its own ideas; both held that our sensible ideas are the immediate effect of the agency of God. In some respects the idealism of Collier is more philosophical than that of Berkeley. He is a more consecutive, if not a more consistent, thinker. He shows what Berkeley omitted to show, the ambiguity of the word *idea*. He anticipates the analysis of Hamilton by raising the question whether the idea exists in the mind as in its proper place, or inheres in it as in its proper subject, or is dependent on it as on its proper faculty. Above all, he shows, in opposition to Berkeley's theory of vision, that the quasi-externality of visual objects is part and parcel of perception, and that it is as much an attribute of the figments of imagination as of the facts of sense.\*

But Berkeley and Collier were like the two women grinding at the mill—the one was taken and the other left; and while the name of the one is known to few, except the antiquaries of philosophy, the name of the other marks a philosophic epoch. And yet even Berkeley has been subjected to all the vicissitudes of fame. Though his great work

\* This question is fully discussed, and, in my opinion, finally determined by Mr. Abbott, in his work on Sight and Touch. Mr. Abbott satisfactorily shows that if the idea of *outness* is not primarily given it can never be subsequently acquired (chap. v). Mr. Mahaffy takes the same view in his

Introduction to Kuno Fischer's Kant, p. xvi. Philosophers who, like Mr. Mill and Professor Fraser, adopt the theory of Berkeley, seem to me, in spite of every artifice of language, to beg the question by assuming *outness* in the medium they employ in their efforts to explain it.

did not, like that of Hume, fall still-born from the press, the speculation which was to revolutionize the philosophy of Europe was at first received with the easy toleration of contempt. According to Swift he made a proselyte of Smalridge, and a few other people of position. But in the world in general he was assailed with the ridicule with which Pyrrho was mocked when he pursued his cook. Brown, the famous opponent of Shaftesbury, tells us, in his *Essay on Satire*, that ‘coxcombs refuted Berkeley with a grin.’ But the grin was not confined to coxcombs. Warburton laughed at the idealist as a mere visionary. Arbuthnot could not suppress a sneer at ‘poor philosopher Berkeley,’ and described him to Swift as enjoying the idea of health after being brought to death’s door by the idea of a fever. Voltaire said it was pleasant to think that ten thousand cannon balls and ten thousand dead men were only so many disagreeable ideas. Johnson looked on the whole ideal system as worthy of no better refutation than that supplied by his memorable kick. Beattie professed to regard the reference of everything to God as something atheistic. Even Reid, who had himself been a Berkeleian, recanted his heresy, did penance as a man of common sense, and recommended his quondam friend the idealist to run his head against a post, and to be clapped into a madhouse for his pains (*Works*, 184). So remote, indeed, was the idealist philosophy from received opinions that even philosophers of a higher mood were unable to accept it. At the instance

of Addison the great *à priori* philosopher of the age met Berkeley in order to discuss the subject; but Berkeley complained that Clarke, though he could not answer him, had not the candour to own himself convinced. Berkeley experienced equal difficulty in convincing the rival philosopher who saw everything God. He discussed the matter with Malebranche in his cell, but so high did the philosophical excitement rise that the visionary died in consequence of his interview with the apostle of ideas. Hume took a characteristic view of the subject. All Berkeley's arguments, he said, though otherwise intended, were in reality sceptical; for while they admitted of no answer, they produced no conviction (*Works*, IV. 181)—a remark which supplies the true justification of Clarke in his refusal to own himself convinced. But the influence which Berkeley was destined to exert was far more powerful than any of his contemporaries suspected. From his time philosophy ceased to concern itself with matter. The authority of the Church was disregarded; the reference to revelation was ignored; and philosophy became ideal. It is scarcely too much to say with Hamann that without Berkeley there would have been no Hume, as without Hume there would have been no Kant—and as without Kant there would have been no Hegel.

But, regarded as a matter of history, the antecedents of a philosophy are as much an object of curiosity as its results; and looking at the subject in this light, it is not to be denied that the idealism of

Berkeley had its starting point in the philosophy of Locke. Locke had taught that the soul is conscious only of its own ideas (I. i. 8); and that these bounds were ample enough for the capacious mind of man to expatiate in, though it takes its flight further than the stars, and cannot be confined to the limits of the world—though it extends its thoughts beyond the utmost expansion of matter, and makes incursions into the incomprehensible inane (II. vii. 10). Our ideas of the sensible qualities of matter Locke had conceived to be produced by *impulse*. But how little Hamilton was justified in identifying his doctrine with the materialism of Democritus and Digby (*Disc.* 78. 81) is evident from Locke's qualification of his own remark. He admits that *motion*, according to the utmost reach of our ideas, is able to produce nothing but motion, and that, when we allow it to produce pleasure and pain, or the idea of a colour or a sound, we are fain to quit our reason, go beyond our ideas, and attribute it wholly to the good pleasure of our Maker (II. iii. 6). In strict accordance with this view, he holds that our knowledge of the existence of spiritual is more certain than our knowledge of the existence of material things. "Whilst I know, by seeing or hearing, &c., that there is some corporeal being without me, the object of that sensation," he says, "I do more certainly know, that there is some spiritual being within me that sees and hears: this, I must be convinced, cannot be the action of bare insensible matter, nor ever could be without an immaterial

thinking being" (II. xxiii. 15). Reid deems it strange that Locke, who wrote so much upon the subject, should not see those consequences which Berkeley thought so obviously deducible from the doctrine of ideas. But this is an injustice to Locke's philosophical acumen. "There can be nothing more certain," he says, "than that the idea we receive from an external object is in our minds; this is intuitive knowledge; but whether there be anything more than barely an idea in our minds, whether we can thence certainly infer the existence of anything without us which corresponds to that idea, is that whereof some men think there may be a question made, because men may have such ideas in their minds when no such thing exists, no such object affects their senses" (IV. ii. 14; IV. xi. 1). Locke, however, evaded the difficulty, and took refuge in the arms of common sense. The confidence that our faculties do not herein deceive us, he said, is the greatest assurance we are capable of, concerning the existence of material beings (IV. xi. 3). "If after all," he said, "any one should be so sceptical as to distrust his senses, and to affirm that all we see and hear, feel and taste, think and do, during our whole being, is but the series and deluding appearances of a long dream, whereof there is no reality, and therefore will question the existence of all things, or our knowledge of anything; I must desire him to consider, that, if all be a dream, he doth but dream that he makes the question, and so it is not much matter that a waking man should

answer him" (iv. xi. 8)—the "evidence is as great as we can desire, being as certain to us as our pleasure or pain, that is, happiness or misery, beyond which we have no concernment either of knowing or being" (*ibid.*). But the ultimate conclusion of Locke was the very starting-point of Berkeley. The knowledge of our own being, he said, we have by intuition—the existence of a God reason clearly makes known to us—and the knowledge of the existence of any other being we can have only by sensation, for there is no necessary connexion of any other existence but that of God, with the existence of ourselves (iv. xi. 1, 13).

The same point had been reached by the disciples of a different school. It was a first principle in the philosophy of Descartes, and Leibnitz, and Malebranche, as it was in that of Locke, that the mind is conscious only of its own ideas. These philosophers, it is true, maintained the existence of a material world without us; but they held that mind and matter are essentially opposed; that, in the words of Norris, they are separated by the whole diameter of existence; and that consequently mind, if left to its own unaided force, can never take cognizance of matter. To bridge this chasm between mind and matter, different philosophical structures had been framed. According to the Cartesians, God, on the occasion of the presence of the external object, caused the mind to be so and so affected. According to Leibnitz, God had so pre-established the independent developments of mind

and matter, that there was an everlasting harmony between them. According to Malebranche, God, being cognizant of everything, was cognizant of matter; and being cognizant of matter, admitted man into a participation of his cognition, so that the mind saw material things in God. The theories of Occasional Causes, Pre-established Harmony, and Vision of the Universe in God, thus conducted to the same point as the Hyperphysical Realism of Locke. The *Deus ex machina* was the last resource of all; and all admitted that the world of matter could only be brought into relation with the mind by the intervention, direct or indirect, of God.

Of all the philosophers who preceded Berkeley, the one who approached most nearly to his conclusion was Malebranche. The French metaphysician regarded it as an indisputable fact, that it is only by means of ideas that the unextended mind can become cognizant of extended objects.\* He contemptuously rejected the argument for the existence of the external world which is based on common sense. With equal contempt he rejected the theory which maintains that external objects make us aware of

\* Mais je parle principalement ici des choses matérielles qui certainement ne peuvent s'unir à notre âme de la façon qui lui est nécessaire afin qu'elle les aperçoive; parce qu'étant étendues, et l'âme ne l'étant pas, il n'y a point de rapports entre eux (*Rech. L. iii. P. ii., c. i.*). C'est incontestable qu'on ne peut voir les choses matérielles par elles-mêmes et sans idées (*ibid.*). Par ce mot *idée*

je n'entends ici autre chose que ce qui est l'objet immédiat, ou la plus proche de l'esprit quand il aperçoit quelque objet (*ibid.*). On ne s'arrête pas à expliquer plus au long ces belles choses et les diverses manières dont différents philosophes les conçoivent (*c. ii.*). On assure donc qu'il n'est pas vraisemblable que les objets envoient des images ou des espèces qui leur ressemblent (*ibid.*).

their existence by the emission of species or entity-ideas. He avowed that according to his way of thinking matter could not even be accepted as the cause of our perceptions or sensations. The experience of delirium and dreams, he said, establishes that there is no necessary connexion between the presence of an idea and the existence of a corresponding thing without. He admitted, as we have seen, that if the world were annihilated, and if God should produce in our minds the ideas which are now produced in them on the presence of external objects, we should perceive everything that we now perceive. How then are we to account for the existence of our sensible ideas? Malebranche considered it evident that these ideas could not be created by the mind itself, for they were not the creatures of the will, and the mind must have had a knowledge of them before it could produce them.\* The obvious conclusion would seem to be that the cause of our sensible ideas must be God. But Malebranche recoiled from this conclusion. He was not only a philosopher but a theologian. Having demonstrated God's existence from

\* Pensez-vous, Ariste, que la matière, que vous ne jugez peut-être pas capable de se remuer d'elle-même, ni de se donner aucune modalité, puisse jamais modifier un esprit, le rendre heureux ou malheureux, lui représenter des idées, lui donner divers sentiments? Pensez-y et répondez moi (*Entret.* vii). Il n'y a point de liaison nécessaire entre la présence d'une idée à l'esprit d'un homme et

l'existence de la chose qui cette idée représente, et ce qui arrive à ceux qui dorment ou qui sont en délire le prouve suffisamment (*Rech.* L. i. c. x). Dans la supposition que le monde fût anéanti, et que Dieu néanmoins produisît dans notre cerveau les mêmes traces, ou plutôt dans notre esprit les mêmes idées qui s'y produisent de la présence des objets nous verrions les mêmes beautés (*Entret.* i).

the idea of infinity, he proceeded to demonstrate the existence of the world by a reference to the word of God. The Scriptures, he said, inform us of the Incarnation of our Lord; the Scriptures inform us that in the beginning God created the heavens and the earth. The existence of the material world being thus established, all that remained was to account for its perception. This Malebranche did on the principles of the Cartesian School. The essence, the primary conception, of matter, he said, was extension; and no extended thing could modify the mind. Declining, therefore, to recognise any secondary qualities in matter, he distinguished our ideas from our sensations; and while he regarded the former as *perceived* by us in God, he regarded the latter as simply *caused* by the Deity in us on the occasion of the presence of external objects.\*

But Berkeley treated the system and the scruples of his illustrious predecessor with but scant respect. God, he said, was not a musician, who required to be directed by notes, in order to produce that har-

Un homme ne peut pas former l'idée d'un objet s'il ne le connaît auparavant, c'est-à-dire s'il n'en a déjà l'idée laquelle ne dépend point de sa volonté. Que s'il en a déjà une idée, il connaît cet objet, et il lui est inutile d'en former une nouvelle. Il est donc inutile d'attribuer à l'esprit de l'homme la puissance de produire ces idées (*Rech.* L. iii. P. ii. c. iii).

\* Lorsque nous apercevons quelque chose de sensible il se trouve dans notre perception sentiment et idée pure.

Le sentiment est une modification de notre âme et c'est Dieu qui la *cause* en nous, et il la peut causer quoiqu'il ne l'ait pas, parce qu'il voit, dans l'idée qu'il a de notre âme, qu'elle en est capable. Pour l'idée qui se trouve jointe avec le sentiment, elle est en Dieu et nous le voyons, parce qu'il lui plaît de nous la *découvrir*; et Dieu joint la sensation à l'idée lorsque les objets sont présents, afin que nous le croyions ainsi, et que nous entrions dans les sentiments et dans les pas-

monious train and composition of sound that is called a tune (*Prin.* lxxi). He protested, in the person of Philonous, that he could not understand how our ideas, which are things altogether passive and inert, can be the *essence*, or any part, or like any part, of the essence or substance of God (*Dial.* ii).<sup>\*</sup> Revelation, he said, had used words in their vulgar acceptation; and the ideal philosophy did not deny the existence of anything which Holy Writ had declared to be existent (*Prin.* lxxxii). In fact, the Scriptures themselves ascribed those effects to the immediate agency of God which the heathen philosophers ascribed to Nature (*Prin.* cl). But the question at issue was one to be determined not by revelation but by reason. And what were the dictates of reason on the subject? They were obvious. If primary and secondary qualities are only 'ideas existing in the mind' (*Prin.* ix), why should we make any distinction between ideas and sensations? If it is possible that we might be affected with all the ideas that we have, although no bodies

sions que nous devons avoir par rapport à eux (*Recherche de la Vérité*, L. iii. P. ii. c. vi).

<sup>\*</sup> Il faut bien remarquer qu'on ne peut pas conclure que les esprits voient l'*essence* de Dieu de ce qu'ils voient toutes choses en Dieu de cette manière. L'essence de Dieu, c'est son être absolu, et les esprits ne voient point en *substance* divine prise absolument, mais seulement en tant que relative aux créatures ou participable par elles (*Rech.* L. iii. P. ii. c. vi).

Demeurons donc en ce sentiment, que Dieu est le monde intelligible ou le lieu des esprits, de même que le monde matériel est le lieu des corps; que c'est de sa *puissance* qu'ils reçoivent toutes leur modifications; que c'est dans sa *sagesse* qu'ils trouvent toutes leur idées; et que c'est par son *amour* qu'il sont agités de tous leur mouvements réglés (*ibid.*). Locke, in his Examination of Malebranche's Opinion, falls into the same error as Berkeley on this point (*Exam.* 31).

existed without which resembled them (*Prin.* xviii), why might not bodies be regarded as the perceptions of a waking dream? If the world is not known as object, and cannot be inferred as cause (*ibid.*), what reason have we to believe in its existence? If, in fine, 'the being of a Spirit infinitely wise, and good and powerful, is abundantly sufficient to explain all the appearances of nature' (*Prin.* lxxii), why should we gratuitously assume the co-operation or the co-existence of any other cause? But Berkeley pushed the argument still further. He contended, not only that we are unable to demonstrate the existence of the world of matter, but that we are able to demonstrate its non-existence. The supposition of an external material world, he said, was unmeaning (*Prin.* xvii)—it was replete with contradictions (*Prin.* iv. xvii. lxvii)—it could not even be conceived (*Prin.* xxiii). How can we conceive objects existing unconceived, he asked, and professed himself willing to put the whole controversy upon that single issue (*Prin.* xxii). True, the series of sensations of which we are conscious, he said, must have some thinking substance or substratum to support them (*Prin.* ii), as well as some active cause by which they are produced and changed (*Prin.* xxvi). But what is the cause in question? Not a mere physical antecedent to be found in antecedent ideas; for our ideas are 'visibly inactive' (*Prin.* xxv). Not corporeal substance; for it had no existence (*Prin.* ix). Neither could the cause in question be ourselves; for the ideas perceived by

sense have no dependence on ourselves—they are not the creatures of the will (*Prin.* xxix). The cause must, accordingly, be God. The whole argument is neatly summarized by Hylas:—"I find myself affected with various ideas whereof I know I am not the cause; neither are they the cause of themselves, or of one another, or capable of subsisting by themselves, as being altogether inactive, fleeting, dependent beings; they have therefore some cause distinct from me and them, of which I pretend to know no more than that it is the cause of my ideas" (*Dial.* ii). Hylas, it is true, makes an abortive attempt to identify this primeval cause with *matter*; but the inexorable Philonous asks, 'Though it should be allowed to exist, yet, how can that which is inactive be a cause, or that which is unthinking be a cause of thought?' (*ibid.*). Hylas is coerced into recognizing the agency of *mind*. "From [the mere perceptions of the senses]," says Philonous, "I conclude that there is a mind which affects me every moment with all the sensible impressions I perceive; and, from the variety, order, and manner of them, I conclude the Author of them to be wise, powerful, and good, beyond comprehension" (*ibid.*). Thus while the *attributes* of the Infinite Mind are collected from a 'contemplation of the contrivance, order, and adjustment of things,' its *existence* is 'necessarily inferred from the bare existence of the sensible world'—and this consideration, in the opinion of Philonous, at once baffles the most strenuous advocate of atheism, and effectually dis-

poses of the wild imaginations of Hobbes, Vanini, and Spinoza (*Dial.* ii).

Whatever may be the force of the argument thus constructed, it is so clear that it might well have been supposed to bid defiance to the powers of misconception. But Berkeley has not escaped the fate which has overtaken philosophers in every age. He has been systematically misunderstood. Mr. Mill has remarked that "he was excelled by none who ever wrote in the clear expression of his meaning, and the discrimination of it from what he did not mean"; yet, he adds, "scarcely any thinker has been more perseveringly misapprehended, or has been the victim of such persistent *ignoratio elenchi*, his numerous adversaries having generally occupied themselves in proving what he never denied, and denying what he never asserted." A singular illustration of the truth of this remark is furnished by the Scottish School. According to Reid, the Idealism of Berkeley was the result of two things—the Ideal Theory which Reid erroneously attributed to the philosophers in general, and the Theory of the Origin of Ideas which he erroneously attributed to Locke. Men, he said, who, like Hume and Berkeley, recognized no ideas but those of sensation and reflection, were compelled to repudiate the idea of substance (*Works*, 322); and anyone who accepted the theory universally received by philosophers concerning ideas would find unanswerable arguments against the existence of the material world (p. 282). In attri-

buting these theories to Berkeley, Reid is followed not only by Stewart and Brown, but by Hamilton and Mansel—nay, stranger still to say, by Mill himself. And yet it is demonstrable that Berkeley held neither of these obnoxious doctrines; and the first duty of an expositor of his philosophy is, to clear his memory from the charge.\*

In arguing against the existence of Matter, Berkeley anticipates a distinction which pervades the whole of recent philosophy. The distinction is taken in the following passages extracted from the second of the Dialogues between Hylas and Philonous, in which he popularizes and explains his Principles of Human Knowledge. “Either you perceive the being of matter immediately or mediately,” says Philonous—“if *immediately*, pray inform me by which of the senses you perceive it; if *mediately*, let me know by what reasoning it is inferred from those things you perceive immediately.” “You neither perceive matter *objectively*,” he continues, “as you do an inactive being or idea, nor know it, as you do yourself, by a reflex act: neither do you *mediately* apprehend it by similitude of the one or the other, nor yet collect it by reasoning from that which you know immedi-

\* As to the Ideal Theory, see Reid's *Works*, i. 282; Stewart's *Works*, v. 88, 422; Brown's *Works*, ii. 17; Hamilton's *Reid*, 288, and *Disc.*, 69; Mansel's *Proleg.* 318; Mill, *ut infra*. As to the Theory of the Origin of Ideas, see Reid's *Works*, 294, 322; Stewart's *Works*, v. 72; Brown's

*Works*, ii. 187; Hamilton's *Lect.* ii. 198; Mansel's *Proleg.* 134; Mill, *ut infra*. In my *Intellectualism of Locke* I have endeavoured to free the prince of the philosophers of England from the charges to which, like the Irish philosopher, he has been exposed. I have recurred to the subject in note A.

ately." In a word, he says, "I have no immediate *intuition* thereof; neither can I mediate from my sensations, ideas, notions, actions, or passions, *infer* an unthinking, unperceiving, inactive substance, either by probable deduction or necessary consequence." From these passages it is plain that Berkeley anticipates Hamilton's celebrated distinction between Presentative or Immediate and Representative or Mediate Cognition (*Reid*, 804); that he repudiates his theory of Natural Realism; and that he adopts the Ideal Theory to this extent, that he holds the mind is conscious of nothing but its own ideas.

But what are the *Ideas* of which alone we are thus asserted to be conscious? According to the Scottish School, the idea of Berkeley is a separate entity—a something numerically distinct from mind—a something which may pass from the mind of man into the mind of God—an essence of the nature of that *tertium quid* which, as Hamilton says, was originally devised to explain the possibility of a knowledge by an immaterial substance of an existence so disproportioned to its nature as a material object. What place a representative idea such as this could have had in a system in which there was nothing to represent it is hard to imagine. Brown clearly perceived that the existence of ideas as separate from the mind is an assumption as gratuitous as the assumption of the external existence of matter itself could have been, and that, in point of fact, permanent and independent ideas are matter under another

name (*Lect.* xxiv). He clearly saw that to believe that these entities exist in the mind is to materialize intellect under the pretence of intellectualizing matter (*ibid.*). But critics, when they imagine their author to be preposterously absurd, are too much carried away by their own sense of superiority to entertain the thought that the author, instead of being preposterously absurd, may possibly have been egregiously misconceived. And that, in this respect, Berkeley has been egregiously misconceived is certain. It is true he tells us that "ideas are inert, fleeting, dependent beings, which subsist not by themselves, but are supported by, or exist in, minds, or spiritual substances" (*Prin.* lxxxix). But Philonous has explained his meaning. "When I speak of objects as existing in the mind, or impressed on the senses," he says, "I would not be understood in the gross literal sense, as when bodies are said to exist in a place, or a seal to make an impression upon wax—my meaning is only that the mind comprehends or perceives them, and that it is *affected from without* by some being distinct from itself" (*Dial.* iii). Nor is Berkeley guilty of any inconsistency in this. States of mind exist, and may therefore be called *existences*; they have a being in the mind, and may therefore be properly denominated *beings*. It is true, as Mill remarks, that "when we have occasion for a name which shall be capable of denoting whatever exists, as contradistinguished from nonentity or nothing, there is hardly a word applicable to the purpose, which is

not also, and even more familiarly, taken in a sense in which it denotes only substances" (*Log.* i. 51). But Berkeley, when he speaks of ideas as 'existing in the mind,' expressly warns us that they 'subsist not by themselves' (*Prin.* lxxxix). He tells us even that "qualities are in the mind only as they are perceived by it, that is, not by way of *mode* or *attribute*, but only by way of *idea*" (*Prin.* xlix). Nay, he has himself indicated the very fallacy pointed out by Mill, and has formally, and repeatedly, explained what is meant by the words *thing*, *reality*, *existence*, and *being*, when applied to the objects of sense (*Prin.* iii. lxxxix. cxlii). Nor has he been less explicit as to the meaning which he attaches to the word *idea*.<sup>\*</sup> His official statement throughout the *Principles of Human Knowledge* is, that 'the existence of an idea consists in being perceived' (*Prin.* ii); that it is not 'possible ideas should have any existence out of the thinking minds, or thinking things, that perceive them' (*Prin.* iii); that they are 'mere sensations that exist no longer than they are perceived' (*Prin.* xlvi):

\* In a note to his *Prolegomena Logica*, Dr. Mansel, after some observations to the flattering character of which I cannot be insensible, professes himself unable to agree with me in regarding Berkeley's theory of ideas as identical with that which represents the idea to be a modification of the mind, and adds that "in Berkeley's system the relation of substance and mode has properly no place" (p. 318). I am not certain

that I understand the significance of this last remark. If it means that Berkeley did not regard the idea as a modification of the mental *substance*, I agree with Dr. Mansel. If it means that Berkeley did not regard the idea as a modification of the mental *sensibility*, I conceive it to be erroneous. But if it means that Berkeley did not recognize the *principle* of substance, then, in my opinion, it is not only erroneous, but it is at variance with

and in the explanatory Dialogues, Hylas, as the result of his discussion with Philonous, is compelled to acknowledge that, "upon a fair observation of what passes in his mind, he can discover nothing else but that he is *a thinking being affected with a variety of sensations*" (*Dial.* i).

The first error of the Scottish School being cleared away, it remains to clear away the second. In the Principles of Human Knowledge, Berkeley states it to be self-evident that the sole 'objects of human knowledge' are *ideas*—ideas imprinted on the senses, ideas formed by memory and imagination, or ideas perceived by attending to the passions and operations of the mind (*Prin.* i). But nothing can be an object of knowledge unless it be presented to something which knows, and accordingly Berkeley assumes the existence of 'an incorporeal, active substance or spirit' (*Prin.* xxvi) —'one simple, undivided, active being,' which, 'as it perceives ideas is called the understanding,' and as it produces or otherwise operates about them is called the will' (*Prin.* xxvii). Of soul or spirit,

the fundamental principles of Berkeley's philosophy, in which it is laid down that all our sensible ideas must have a cause, and that every cause must be a substance. This is clearly perceived by Professor Maguire, in his masterly tract on Berkeley's Notion of Substance; but as to the nature of Berkeley's *idea*, he says that, "with Dean Mansel and Professor Webb to force it into any one of Hamilton's three forms of Hypothetic

Realism is idle, for the phrases *in the mind* and *without the mind* have no reference whatever to locality." But Hamilton's analysis of the possible forms of the representative hypothesis is applied by him to the various forms of Idealism as freely as to Hypothetical Realism itself (*Reid*, 817). 'Berkeley,' he says, 'is one of the philosophers who really held the doctrine of ideas, erroneously, by Reid, attributed to all' (*Reid*, 288).

Berkeley admits, we can form no *idea* (*ibid.*); nay, he admits that ‘such is the nature of spirit, or that which acts, that it cannot be of itself perceived but only by the effects which it produceth’ (*ibid.*). Still he contends that ‘we have some *notion* of soul, spirit, and the operations of the mind’ (*ibid.*); and accordingly he holds that ‘human knowledge may naturally be reduced to two heads, that of *ideas* and that of *spirits*’ (*Prin.* lxxxvi). But Berkeley goes still further. Not only does he insist that ‘we may be said to have some knowledge or notion of our own minds, of spirits and active beings, whereof in a strict sense we have not ideas’; but he also insists that ‘in like manner we know and have a notion of relations between things or ideas, which relations are distinct from the ideas or things related, inasmuch as the latter may be perceived by us without our perceiving the former’; and he accordingly concludes that ‘*ideas*, *spirits*, and *relations* are, all in their respective kinds, the object of human knowledge and subject of discourse’ (*Prin.* lxxxix).

In all this there is doubtless much confusion, much variation of statement, much ambiguity of expression; but it may be taken on the whole as certain that Berkeley divided the data of consciousness into two classes, *ideas* and *notions*; that under the head of ideas he comprehended Locke’s *ideas of reflection*, and under that of notions those *ideas of relation* which Locke regarded as ‘the creations and inventions of the understanding.’ Among these conceptions of the understanding Berkeley, like his

master, recognized the notions of essential substance and efficient cause as distinguished from our notions of a mere permanent collection of qualities and uniform series of events. It is true that Berkeley—and it is the great defect of his philosophy—gave no systematic explanation of our notions, and has even left his views in obscurity as to the mode in which these notions are evolved. In his *Principles* he assumes the existence of a substantial cause to account for the existence of our sensible ideas, because, as he says, it is ‘*repugnant* that they should subsist by themselves’ (*Prin.* cxlvi). In his *Vindication of his Theory of Vision*, he explains them to be an ‘inference of reason,’ as distinguished from an ‘object of sense,’ and maintains that ‘from our ideas of sense the inference of reason is good to power, cause, agent’ (sect. xi). In his *Siris*, however, he is more explicit. He professes to effect a compromise between the *tabula rasa* of Aristotle and the *innate ideas* of Plato, and suggests that though ‘there are properly no ideas or passive objects but what were derived from sense,’ yet ‘there are also besides these her own acts or operations, such as notions,’ which must be referable to the understanding (*Siris*, 308). For here Berkeley clearly approximates to Kant. ‘As *understanding* perceiveth not,’ he says, ‘so *sense* knoweth not’ (s. 305). He acknowledges with Kant that sensible objects ‘make the first impressions,’ and that ‘the mind takes her first flight and spring, as it were, by resting her foot on these objects’ (s. 292); but, with

Kant, he contends that 'the *mind*, her acts and faculties, furnish a new and distinct class of objects, from the contemplation whereof arise certain other notions, principles, and verities,' remote from sense (s. 297); and maintains that 'the *mind* contains all, and acts all, and is to all created beings the source of unity and identity, harmony and order, existence and stability' throughout the world (s. 295).

And yet it would be a mistake to identify the psychology of Kant with that of Berkeley. According to Berkeley's official doctrine the mind is purely passive in the reception of its sensible ideas, and therefore contributes nothing to their formation. It does not frame them in any forms of sensibility; it does not combine them into unity by any synthetic power of apperception; it does not anticipate their permanence or their recurrence by any category of the understanding. Time, according to Berkeley, is nothing, abstracted from the succession of ideas (*Prin.* xcvi); space is nothing but the absence of resistance (*Prin.* cxvi). Sensible objects he regarded not as collected together by the mind, but as presented in 'artificial and regular combinations' by their author (*Prin.* lxv). He recognizes the 'foresight' which enables us to regulate our actions for the benefit of life (*Prin.* xxxi); the 'prognostics' which we form as to the permanent coexistence of our ideas (*Prin.* xlv); the 'predictions' which we make concerning the ideas we shall be affected with pursuant to a train of

actions (*Prin.* lix): but the only way in which he offers to explain these anticipations of experience is by saying that God operates by the 'established methods' which we call the laws of nature (*Prin.* xxx), and that they are derived 'from the experience we have had of the train and succession of ideas in our minds' (*Prin.* lix). But Berkeley seems never to have raised the question which was raised and answered by Hume, and answered still more explicitly by Kant—How is it that from the experience we have had we can form any *à priori* conclusion as to the experience we are about to have? He seems never to have asked himself why it is that we form the expectation that God will continue to act in the future, as we know that he has acted in the past. He seems never to have clearly seen that the permanence of the phenomena of sense and the continuity of their sequences must be *assumed* in every physical investigation, and that being necessary assumptions they must be regarded as *anticipations* of the understanding which antecedent experience may suggest, and which subsequent experience may confirm, but which no modification of mere experience can explain.

But if Berkeley does not explain the unity of human knowledge by the Kantian synthetic unity of apperception, there can be no doubt that he fully recognizes in the mind a synthetic unity of *substance*; and his consistent assertion that the soul must be regarded as a thinking substance should, at least, have saved him from one of the persistent

misrepresentations to which his philosophy has been exposed. According to Reid, the argument which maintains that matter is merely 'a bundle of sensations,' is equally applicable to the mind; and accordingly he gives Hume credit for consistency in reducing mind itself to a mere 'bundle of thoughts and passions and emotions' (*Works*, 293). But Reid failed to observe that while Berkeley recognized the principle of substance in all its metaphysical reality, Hume, differing from both him and Locke, ignored it. He failed to recollect that, while Berkeley held that matter was a mere bundle of sensations, he held that it was a mere bundle of sensations in the mind, and that mind, as the 'substratum of those ideas,' must of necessity be a substance (*Prin.* vii. xxvi. cxlvi). If Berkeley denied material substance, it was not because he thought that material qualities could exist without a material substratum, but because he thought that material qualities could not by any possibility exist without a mind (*Prin.* lxxiii). But here again Reid's error is without excuse; for Berkeley anticipated this very objection, and met it in advance. "In consequence of your own principles," says Hylas to Philonous, "it should follow that you are only *a system of floating ideas*, without any substance to support them" (*Dial.* iii). "How often must I repeat," says Philonous to Hylas, "that I know, or am conscious of, my own being, and that I myself am not my ideas, but somewhat else—a thinking, active principle that perceives, knows, wills, and operates about ideas?" Philonous

speaks of this fact as known by ‘*consciousness*,’ as he previously speaks of it as known by a ‘*reflex act*,’ and by ‘*reflection*.’ But Berkeley’s official doctrine is, that the conception of substance, like the conception of causation, is a *notion* which the mind is compelled by its own necessities to form, since, whatever our ideas may be, ‘it is repugnant that they should subsist by themselves’ (*Prin.* cxlvi).

But even Mr. Mill is so carried away by the prevailing error, that he falls into the pit which he himself has pointed out. He too occupies himself in proving what Berkeley never denied, and in denying what Berkeley never asserted—nay, he actually charges him for failing to say what he has expressly said. Berkeley, according to Mr. Mill, “supposed that the actual object of a sensible perception, though, on his own showing, only a group of sensations, etc., suspended so far as we are concerned, when we cease to perceive it, comes back literally the same the next time it is perceived by us; and, being the same, must have existed in another mind. He did not see clearly that the sensations I have to-day are not the *same* as those I had yesterday, which are gone never to return, but are only exactly similar; and that which has been kept in continuous existence is but a potentiality of having such sensations, such potentiality implying constancy in the order of phenomenon, but not a spiritual substance for the phenomena to dwell in, when not present to my own mind.”\* But

\* *Fortnightly Review* of November, 1872, p. 518.

Berkeley puts the very words of Mill into the mouth of Hylas. "The same idea which is in my mind cannot be in yours, or in any other mind," says Hylas—"doth it not, therefore, follow from your principles that no two can see the same thing, and is not this highly absurd?" "If the word *same* be taken in the vulgar acceptation," replies Philonous, "it is certain (and not at all repugnant to the principles I maintain) that different persons may perceive the same thing, or the same thing, or idea, exist in different minds. Words are of arbitrary imposition; and since men are used to apply the word *same* where no distinction or variety is perceived—and I do not pretend to alter their perceptions—it follows that, as men have said before, several saw the same thing, so they may, upon like occasions, still continue to use the same phrase without any deviation, either from the propriety of language or the truth of things." "But whether philosophers shall think fit to call a thing the same or no," Philonous continues, "is of small importance. Let us suppose several men together, all endued with the same faculties, and consequently *affected in like sort* by their senses, and who had yet never known the use of language; they would, without question, agree in their perceptions, though, perhaps, when they came to the use of speech—some, regarding the uniformness of what was perceived, might call it the *same* thing; others, especially regarding the diversity of persons who perceived, might

choose the denomination of *different* things " (*Dial.* iii).\*

But the misapprehension of Mill reaches further than Berkeley's theory of the world; it reduces to an absurdity his demonstration of the existence of a God. That demonstration Mackintosh regarded as the touchstone of metaphysical sagacity. But what metaphysical sagacity is evinced by the Berkeleyian who supposes that Berkeley postulated the Deity as 'a spiritual substance for the phenomenon to dwell in'? The conception of substance undoubtedly plays a conspicuous part in the philosophy of Berkeley; but in his demonstration of the existence of God the dominant idea is not substance, but *causation*. Not only does Mill ignore this function of causation—he reproduces in its crudest form the blunder of Brown as to the nature of Berkeley's sensible ideas. "These," says Brown, "he evidently considered not as states of the individual mind, but as *separate things* existing in it,

\* Collier makes a similar remark. "When I affirm that all matter exists in mind, or that no matter is external, I do not mean that the world, or any visible object of it, which I, for instance, see, is dependent on the mind of any other person besides myself; or that the world, or matter, which any other person sees is dependent on mine, or any other person's mind or faculty of perception. On the contrary, I contend, as well as grant, that the world which John sees is external to Peter, and the world which Peter sees is external to John; that is, I

hold the thing to be the same in this as in any other case of sensation; for instance, that of sound. Here, two or more persons who are present at a concert of music may, indeed, in some sense be said to hear the *same* notes or melody; but yet the truth is, that the sound which one hears is not the very same with the sound which another hears, because the souls, or persons, are supposed to be different" (*Clavis*, p. 6). Compare with this the corresponding passage in the *Clavis* as to the mundane idea existing in the mind of God (p. 79).

and capable of existing in other minds, but in them alone; and it is in consequence of these assumptions that his system, if it were to be considered as a system of scepticism, is chiefly defective. But having, as he supposed, these ideas, and conceiving that they did not perish when they ceased to exist in his mind, since the *same ideas* recurred at intervals, he deduced, from the necessity which there seemed for some Omnipotent Mind, in which they might exist during the intervals of recurrence, the necessary existence of the Deity; and if, indeed, as he supposed, ideas be something different from the mind itself, recurring only at intervals to created minds, and incapable of existing but in mind, the demonstration of some Infinite Omnipresent Mind, in which they exist during these intervals of recurrence to finite minds, must be allowed to be perfect" (*Lect.* xxiv). But, says Brown, "the whole force of the pious demonstration, which Berkeley flattered himself with having urged irresistibly, is completely obviated by the simple denial that ideas are anything more than the *mind itself affected in a certain manner*; since in this case our ideas exist no longer than our mind is affected in that particular manner which constitutes each particular idea" (*ibid.*).

And yet Berkeley adopts the very words of Brown. 'I can discover nothing else,' says Hylas, 'but that I am a thinking being *affected* with a variety of sensations' (*Dial.* i); and it is from this fact that Philonous concludes 'there is a mind

which *affects* me every moment with all the sensible impressions I perceive' (*Dial.* ii). But what significance could Brown have seen in that form of the demonstration which he considers perfect? Ideas are separate entities, which can exist nowhere but in mind; these ideas perpetually recur; therefore there must be some mind in which they exist during the intervals of their recurrence; therefore there must be a God. What man in his senses could imagine that anyone would be converted to theism by reasoning such as this? The argument attributed by Brown to Berkeley is much the same as the argument attributed by Cicero to Epicurus.\* But Epicurus was an atheist, and his argumentation, according to Cicero, was nothing but a make-believe. The only difference between the theory of entity-images and the theory of entity-ideas is one in favour of the former. The materialist made the image flow from God to man, and left us *some* proof of his existence—the immaterialist makes the ideas flow from man to God, and leaves us to postulate a God as a material receptacle for a shoal of fugitive ideas—a receptacle as material as the crystal tank into which gold and silver fish may be conceived as escaping from their crystal bowl.†

\* Epicurus docet eam esse vim et naturam Deorum, ut primum non sensu, sed mente cernatur; nec soliditate quadam, nec ad numerum, ut ea quæ ille propter firmitatem *στερέμνια* appellat, sed imaginibus similitudine et transitione perceptis" (*De Nat.* i. 18). Velleius adds, "cum infinita

simillarum imaginum species ex innumerabilibus individuis existat, et ad deos affluit"—the ἀνήριθμον γέλασμα of ideas in the 'pious demonstration' attributed to the Christian idealist by Brown.

† Mansel, who substantially agrees with Brown, states the argument of

Berkeley undoubtedly states that there must be some other mind wherein ideas exist during the intervals of our perception ; but the explanation of this, after what has been already said, is easy. If our sensible ideas are not the spontaneous product of the mind itself, they must be produced from without ; if they are produced from without, they must be produced by some cause which has intelligence of the effects which it produces ; and if that cause has intelligence of the effects which it produces, the idea of the effect to be produced must exist and pre-exist in its intelligence, as the idea of the effect to be produced exists and pre-exists in the mind of the musician, the painter, or the poet. It is thus that Malebranche contends that the ideas of all terrestrial things existed in the mind of the Creator before the date of the creation. It is thus that Collier admits the existence of the great mundane idea of created matter by which all things are produced, by which the great God gives sensations

Berkeley in the following form:—  
 “With this argument, which represents God as the efficient cause of our ideas, Berkeley combined another, in which the Deity is regarded as a constantly perceiving mind. Accepting, as allowed on all hands, the opinion that sensible qualities cannot subsist by themselves, and rejecting the ordinary hypothesis of their existence in an insensible substratum, he concluded that they must, therefore, exist in a mind which perceives them, and that they have no existence apart from being perceived. If, therefore,

they continue to exist when *we* do not perceive them (and that they do so is the irresistible conviction of all men), they must be perceived by some other mind. Hence the continuous duration of things implies the existence of a constantly percipient mind : that is, of God” (*Proleg.* 317). But sensible qualities, according to Berkeley’s view, are only sensible ideas, and sensible ideas themselves are nothing but sensations ; and the statement, that sensible qualities, thus understood, continue to exist when *we* do not perceive them, is ambiguous. *Our*

to all his thinking creatures, and by which things which are not are preserved and ordered in the same manner as if they were (*Clavis*, p. 7). It is in this sense that Philonous acknowledges a two-fold state of things—the one ectypal or natural, the other archetypal and eternal; the one created in time, the other existing from everlasting in the mind of God (*Dial.* iii).<sup>\*</sup> But the ideas which existed from everlasting in the mind of God are not the *same* as the ideas which exist for a moment in the mind of man; and the ideas which cease to exist in the mind of man are not the same as the ideas which have no cesser of existence in the mind of God. The eternal existence of objects in the mind of God is, in fact, only another phrase for his eternal knowledge. “All objects,” says Philonous, “are eternally known by God, or, which is the same thing, have an eternal existence in his mind; but when things, before imperceptible to creatures, are by a decree of God perceptible to them,

sensations cease to exist when our perception of them ceases. *Similar* sensations, it is true, may be experienced by others, and thus, and thus only, things may have a continuous duration. The sensations so experienced require, on Berkeley's theory, the intervention of an efficient cause, which, being intelligent, must be percipient of the effect which it produces; and it is only in this sense that Berkeley contends that the continuous duration of things implies the existence of a constantly perceiving mind.

\* Il est indubitable qu' il n' y avait que Dieu seul avant que le monde fût créé, et qu' il n' a pu le produire sans connaissance et sans idée; que par conséquent ces idées, que Dieu en a eues ne sont point différentes de lui-même, et qu' ainsi toutes les créatures, même les plus matérielles et les plus terrestres, sont en Dieu, quoique d'une manière toute spirituelle et que nous ne pouvons comprendre (*Rech.* L. iii. P. ii. c. v). With this compare the proof that our Ideas are not created by the mind (*sup.* p. 15).

then they are said to begin a relative existence with respect to created minds" (*Dial.* iii). It is this relative existence which, in the opinion of Berkeley, constitutes the world to us. So completely relative is that existence, that it is relative not only to the person but to the moment. The world is nothing but successive phenomenon and evanescence. Our ideas have no continuous existence. They disappear to be succeeded by ideas which are similar, but not the same; and these successive ideas in their similar succession are mere sparkles on the stream of thought—mere bubbles on the river, which glitter in the sun and burst.\*

Berkeley carried out this view of the fleeting nature of ideas to its most sublime result. If the world exists only in idea, and if ideas are mere evanescent states of mind, it follows that the Divine Energy is for ever engaged in creating and re-creating worlds. Accordingly, in the opinion of

\* The following remarks of Ferrier, in his *Institutes of Metaphysic*, are worthy of attention:—"The system of Bishop Berkeley, also, was vitiated by the absence of this analysis, or by the neglect to distinguish the necessary from the contingent conditions of cognition. He falls into the error consequent on the adoption of the first of the alternatives just referred to [that of elevating the senses, considered as elements of cognition, to the same footing of necessity with the ego.] He saw that something subjective was a necessary and inseparable part of every object of cognition.

But instead of maintaining that it was the ego, or oneself, which clove inseparably to all that could be known, and that this element must be thought of along with all that is thought of, he rather held that it was the senses, or our perceptive modes of cognition, which clove inseparably to all that could be known, and that these required to be thought of along with all that could be thought of. These, just as much as the ego, were held by him to be the subjective part of the total synthesis of cognition, which could not by any possibility be disconnected. Hence the unsatisfactory cha-

Berkeley, the work of the Creator did not terminate upon the sixth day, but is continued through the ages. The birth of each new creature is the herald of a new creation. Each moment the universe is anew created in every individual mind. Creation never ceases. When Alciphron, in the Minute Philosopher (*Dial.* iv), objects to the notion of Euphranor, that God daily speaks to our senses in a manifest and clear dialect, Crito replies:—“This language hath a necessary connexion with knowledge, wisdom, and goodness. It is equivalent to a *constant creation* betokening an immediate act of power and providence. It cannot be accounted for by mechanical principles, by atoms, attractions, or effluvia. The instantaneous production and reproduction of so many signs, combined, dissolved, transposed, diversified, and adapted to such an endless variety of purposes, ever shifting with the occasions and suited to them, being utterly inexplicable

racter of his ontology, which, when tried by a rigorous logic, will be found to invest the Deity—the supreme mind, the infinite Ego—which the terms of his system compel him to place in synthesis with all things, with human modes of apprehension, with such senses as belong to man; and this, not as a matter of contingency, but as a matter of necessity” (p. 389). How far Berkeley neglects to distinguish the necessary from the contingent conditions of cognition we have already seen. But the final objection made by Ferrier is anticipated by Berkeley, and put into the mouth

of Hylas. Philonous replies that though God is ‘the cause of our sensations,’ and therefore must ‘understand’ what sensation is, yet he ‘perceives nothing by sense,’ and cannot possibly be ‘affected with sensation’ (*Dial.* iii). Malebranche gives a similar reply to the same objection (*Rech.* L. iii. P. ii. c. vi). But though this reply meets Ferrier’s objection, it suggests another. If the world in the mind of man is a mere series of sensations, where is the correspondence between the ectypal world existing in the mind of man and the archetypal world existing in the mind of God?

and unaccountable by the laws of motion, by chance, by fate, or the like blind principles, doth set forth and testify the immediate operation of a Spirit or thinking being, and not merely of a Spirit, which every motion or gravitation may possibly infer, but of one wise, good, and provident Spirit which directs, and rules, and governs the world" (s. xiv).

Such is the standpoint of the philosophy of Berkeley. That philosophy recognized the substantial existence of nothing but Spirits, Finite or Divine. It ignored the world of matter; and it ignored the world of entity-ideas. It allowed of no mediation between the human mind and the Divine; it left the soul, as it were, face to face with God. It is true, we did not see God; but everything we saw, and heard, and felt, was an effect of his wisdom—an intimation of his presence. God was not far from every one of us. He upheld everything by the word of his power. His sound was gone out into all lands, and his words into the end of the world. In him we lived, and moved, and had our being. Such, as expressed by himself in the phraseology of Scripture, was the theory of Berkeley. Such was the lofty conception of the great Idealist—a conception the loftiest, perhaps, to which the mind of man, poised on the wings of imagination and intellect, has soared.

The criticism of Kant on the system of his famous predecessor is well known. Berkeley's idealism, he said, was a mere dogmatical idealism (*Kritik*, 166); holding that 'space, together with all

the objects of which it was the inseparable condition, is a thing which is in itself impossible,' he was constrained to hold that 'the objects in space are mere products of the imagination' (*ibid.*), and to 'degrade bodies to mere illusory appearances' (p. 42). That Berkeley regarded space not as a form of sensibility which supplied a factor in the formation of our sensible ideas, but as a child of imagination grafted upon sense, we have already seen (*Siris*, 292). We have seen that he held our sensible ideas to be passive and inert; that he regarded the world of a sense as a mere picture exhibited to us by the Omnipresent and Eternal Mind. But still he maintains that the appearances which are seen on the theatre of the world are produced by an artful hand which is concealed behind the scenes, and that they are imprinted on the senses by a constantly operating cause in accordance with unchanging laws (*Prin.* lxiv). It is this that constitutes at once the permanence and the reality of the world of sense. It is by this that *real things* are distinguished from chimeras (*Prin.* xxxiii). But the objection of Kant recoils in a measure on himself. If he meets Fichte half way, and insists that sensible objects are moulded by intuitions of time and space, of which we are ourselves the source, he at the same time maintains with Berkeley that the sensations, without which the intuitions of time and space would be mere empty forms, are produced by the ceaseless operations of a Transcendent Cause which lies beyond the sphere of sense, but which origi-

nates the experience of the permanence and constancy of which the categories are mere anticipations.

There is one point, however, in Berkeley's system in which reality is conspicuously imperilled, and that is, the existence of *finite spirits* other than ourselves. This, indeed, is the weak point in every idealistic system; and Berkeley frankly admits that it is a weak point in his own.\* He grants that 'we have neither an immediate evidence nor a demonstrative knowledge of the existence of other finite spirits' (*Dial.* iii). Human agents, he says, are 'marked out and limited to our view by a particular finite collection of ideas' (*Prin.* lvii); and the knowledge we have of them 'depends on the intervention of ideas by us referred to agents or spirits distinct from ourselves, as effects or concomitant signs' (*Prin.* cxlv); but he confesses that it is God alone who 'maintains that intercourse between spirits, whereby they are able to perceive the existence of each other' (*Prin.* cxlvii). This immediately suggests a difficulty which it is sufficient to indicate, and on which it is impossible to dwell. "In making God the immediate author of all the

\* Malebranche feels himself compelled to make the admission that, on the principles of his philosophy, the existence of finite spirits other than ourselves is a mere *conjecture*:—De tous les objets de notre connaissance, il ne nous reste plus que les âmes des autres hommes et que les pures intelligences, et il est manifeste que nous

ne les connaissons que par *conjecture*. Nous ne les connaissons présentement ni en elles-mêmes ni par leurs idées; et, comme elles sont différentes de nous, il n'est pas possible que nous les connaissions par conscience. Nous *conjecturons* que les âmes des autres hommes sont de même espèce que la nôtre (*Rech.* L. iii. P. ii. c. vii).

motions in nature," says Hylas, "you make him the author of murder, sacrilege, adultery, and the like heinous sins" (*Dial.* iii). Philonous answers that sin does not consist in the outward physical act, but in the internal deviation of the will; and that the denial of the existence of any agent but spirit is 'consistent with allowing to thinking rational beings, in the production of motions, the use of limited powers, ultimately, indeed, derived from God, but immediately under the direction of their own wills.' But the answer of Philonous will scarcely be as satisfactory to the reader as it was to honest Hylas. In one respect, indeed, the works of man, on the principles of Berkeley, may be said to take their place among the works of nature. The creations of genius remain when artist and architect have passed away. The Transfiguration is as imperishable as any material thing that can perish, and St. Paul's, while it endures, is as much a portion of the sense-world as Ben Lomond. God reproduces their ideas, and makes the creations of man a portion of his own. But this does not meet the point of the objection urged by Hylas. The production of a motion in myself is very different from the production of a pleasurable sensation in another. A motion, on Berkeley's principles, is only an idea (*Prin.* cxi), and on those principles an idea cannot be the cause of an idea in ourselves (*Prin.* xxv), and *à fortiori* cannot be the cause of a sensation in another. Such a sensation, it is true, may be referred to the preceding motion,

as its 'concomitant sign' (*Prin.* cxlv); but the relation between sign and thing signified is not the relation of cause and effect (*Prin.* lxv). Berkeley, in fact, concedes the point. 'It is evident,' he says, 'that in affecting other persons the will of man hath no other object than barely the motion of the limbs of his body; but that such motion should be attended by or excite any idea in the mind of another depends on the will of the Creator' (*Prin.* cxlvii). Berkeley thus adopts the theory of Divine Assistance, and admits that it is God who causes certain sensations to exist in one on the occasion of certain volitions in another.

But the great obstacle in the way of the Berkeleian conception of the world is the difficulty of realizing it in thought. The boundless abyss of space with its infinitude of worlds, the immense geologic periods through which our own world has existed, the stupendous convulsions of which the fabric of the earth has been the scene, the mighty revolutions to which the human race itself has been subjected ever since its first appearance on the planet, and the mysterious social forces and miraculous agencies of nature, which are constantly obtruding themselves upon our wondering gaze—all these potent realities persistently decline to be superseded by ideas, and to be relegated to the realms of shade. But not only does the ideal theory tax the imagination beyond its strength—it positively reverses all our natural modes of thought. We have been accustomed to believe that the world contains the

soul; but we are required to believe that the soul contains the world. We have been accustomed to believe that the body contains the mind; but we must learn to believe that the mind contains the body. We have been accustomed to believe that our fellow-creatures exist without the mind; but we must constrain ourselves to believe that while their souls exist without the mind, their bodies exist within it. Nay, further, we have been accustomed to think that 'the great globe and all that it inhabit' are contained in space; but we have to learn that *within* and *without* are mere relative ideas, and that space is nothing but the absence of resistance. We have been accustomed to believe that we exist in time; but we have to learn that there is no time for us to exist in—that time is nothing abstracted from the succession of our thoughts. All this must be followed out to its rigorous results. If there is no space but only the idea of space, then there is no motion but only the idea of motion. If there is no time but only the idea of time, then there is no duration but only the idea of duration. The mind therefore is motionless amid commotion; it is a mere *punctum stans* amid the lapse of years. These paradoxes Berkeley fearlessly accepts, and transfers them from the Enneads of Plotinus to the Siris (ss. 270, 271). Speculations like these may silence but they do not satisfy the mind. As Hume remarks, they admit of no answer, but they produce no conviction. Their only effect is to cause that momentary amazement and irresolution

and confusion which, as the great sceptic remarks, is only scepticism in disguise (*Works*, iv. 181).

For what, in a speculative point of view, is the value of the idealist philosophy? Consider the points which Berkeley endeavours to establish. He maintains the absolute impossibility of matter; he holds that our sensible ideas cannot be generated from within; he contends that the being of a Spirit infinitely wise, good, and powerful, is abundantly sufficient to explain all the appearances of nature (*Prin.* lxxii). That the contrary of this cannot be proved against him may be well conceded. It is possible that the world of matter may have no existence. It is possible that the soul may be endowed with no originative powers of sense. It is possible that all the sensible ideas which we experience may be the result of the immediate agency of God. But possibility is not proof; and what is the proof which Berkeley adduces that these possibilities are facts? To establish his ultimate conclusion he seems to follow a rigorously inductive method. He professes first to ascertain the facts of consciousness, and then by these facts to test the various hypotheses which have been elaborated to explain them. He collects the various anticipations of the mind; he effects the requisite exclusions or rejections; and he seemingly arrives at the necessary conclusion by induction. The cause of sensation, he says, must be either the world, the soul, or God; but it cannot be the world or the soul; therefore it must be God. But this is a mere travesty of the

Baconian process. It is the form of induction without the power. The principles which it assumes are unverified; the very facts by which he affects to exclude the hypotheses which he rejects are incapable of proof.

For how does Berkeley attempt to prove, as a substantive proposition, that there is no material world? In the first place, he assumes as an axiom, that admits of no dispute, that the mind is conscious only of its own ideas. If it be contended, as it is contended by Hamilton, that the mind has a presentative, objective, intuitive knowledge of material things—that the material world is presented as an existing object, and not merely inferred as an efficient or as a co-operative cause—the idealist appeals to consciousness and denies the fact. We do not perceive matter objectively, he says; we have no immediate intuition of its existence; we are conscious only of our own ideas. But, if matter be not given, why may not its existence be inferred? To conceive matter as existing without the mind, says Berkeley, you must conceive it as existing unconceived; and this, he says, is a contradiction in the very terms in which the so-called conception is expressed (*Prin.* xxiii). But if, as Berkeley himself insists, we can conceive God and finite spirits as existing independently of our conceptions, why may we not conceive the world as similarly existing? The question is put by Hylas, and Philonous merely repeats that, as a matter of fact, we neither objectively perceive, nor rationally appre-

hend, the world of matter (*Dial.* iii). But, says Berkeley, "what are sensible objects but the things we perceive by sense; and what do we perceive besides our own ideas, or sensations; and is it not plainly repugnant that any one of these, or any combination of them, should exist unperceived?" (*Prin.* iv). But, as Berkeley's first contradiction was a mere quibble, so his second is a mere begging of the question. 'All extension exists only in the mind,' he says (*Prin.* lxvii). But why may we not hold that there is an extension without corresponding to the idea of extension which is within? why may we not hold, with Locke, that our ideas of the primary qualities are resemblances? Berkeley answers, 'an idea can be like nothing but an idea; a colour or figure can be like nothing but another colour or figure' (*Prin.* viii). But if the ideas of the primary qualities may not be said to *resemble*, why may they not be said to *represent*, their objects? Let us concede, however, that the world is neither given as an *object*, nor to be imagined as a *counterpart* of our ideas. Why may it not be supposed as the *cause* of our sensations? That which is inactive and *unthinking*, says Berkeley, can never be regarded as the cause of thought. But why? To assert that matter is inactive is again to beg the question; to assert that that which is unthinking cannot be the cause of thought, is to maintain that like can only be produced by like; and to rely on either proposition is to maintain that our human conceptions are the measure of the possi-

bilities of things. Matter, though it should be allowed to exist, says Philonous, is conceived as essentially inactive (*Dial.* ii). But what if it be maintained, with Democritus, that the world is a congeries of atoms, each endued with the principle of motion? What if it be maintained, with Strato, that the several parts of matter are endowed with a plastic life, whereby they dispose themselves to the best advantage? What if we hold with Leibnitz that the world is a system of metaphysical units, each an atom of substance with an internal principle of change? What if we hold with Boscovich, that the world is a system of mathematical points, each a centre of attraction and repulsion, each alive with force? What, in fine, if we embrace the theory which has been handed down from Pythagoras to Pope, and say—

All are but parts of one stupendous whole,  
Whose body Nature is, and God the soul?

But granting matter to be active, Berkeley rejoins, we must at least admit it to be incapable of thought. And yet what Materialist will concede him this? Even if it be conceded, the conclusion of Berkeley is unproved. How can that which is unthinking, he asks, be considered as a cause of thought? But here again a whole world of speculation is tacitly assumed. Is it certain that like must be produced by like? What if the theory of Heraclitus be correct, and all effect be the result of *opposition*? Why, in any case, assume the truth of the rival principle which Empedocles professed?

That principle is not a law of nature—it is not even a law of thought. It is merely one of the oracular utterances of the great Sicilian—divini pectoris ejus—which was accepted as readily by Lucretius in the interests of materialism as it was by Berkeley in support of the theory that there is no such thing as matter.

But there is a psychological difficulty in the way of Berkeley which aggravates the difficulties in the way of his ontologic demonstration. He admits that his system is opposed to vulgar notions. He admits that ‘it is an opinion strangely prevailing amongst men, that houses, mountains, rivers, and, in a word, all sensible objects, have an existence natural or real distinct from their being perceived by the understanding’ (*Prin.* iv). He admits that men ‘act as if the immediate cause of their sensations, which affects them every moment, and is so nearly present to them, were some senseless unthinking being’ (*Prin.* liv). Even Mr. Mill, when he reduces the whole material world to ‘a permanent possibility of sensation,’ is compelled, in like manner to admit that ‘the majority of philosophers fancy that it is something more, and that the world at large would, if asked the question, undoubtedly agree with the philosophers’ (*Exam.* 235). Berkeley boldly refers the belief to the vast number of prejudices and false opinions which are everywhere embraced with the utmost tenacity by the unreflecting portion of mankind (*Prin.* lv); and endeavours to explain it by the knowledge that our ideas are

‘imprinted from without’ (*Prin.* lvi)—by the belief that sensible qualities exist without the mind (s. lxxiii)—by ‘a nicer strain of abstraction’ (s. v)—by the fact that ‘we are apt to think every noun substantive stands for a distinct idea’ (s. cxvi).<sup>\*</sup> It is strange that Berkeley, whose whole system is based on our natural belief in the principles of substance and causation, should thus attempt to explain away a belief which is equally natural, and to banish it to the region of prejudice and false opinion. Mill, who is quite as dogmatic, is more consistent. When challenged on the point, he is not content with resolving the most powerful belief of the human race into ‘the tendency of the human mind to infer differences of things from differences of names’ (*Exam.* 235). He resolves our idea of substance into ‘the tendency to mistake mental abstractions, even negative ones, for substantive realities’ (p. 236); he resolves our idea of causation into ‘our tendency to believe, that a relation which subsists between every individual item of our experience and some other item, subsists also between our experience as a whole and something not within the sphere of our experience’ (p. 237); and he triumphantly adds, that ‘if all these considerations put together do not completely explain and account for our conceiving these possibilities as a class of independent and substantive entities, he knows not what psychological analysis can be conclusive’ (p. 238). But what are all these tendencies on

<sup>\*</sup> On Berkeley’s views as to Abstract Ideas, see Note B.

which Mill so vigorously insists? If they are natural and necessary tendencies, then, as natural and necessary, they are in reality a form of those innate principles which he so strenuously assails; if they are neither natural nor necessary, then he gratuitously substitutes arbitrary principles of error for a natural principle of belief, which can never be demonstrated to be false. For the belief in the existence of matter cannot be compared to the theory that the earth is flat or to the theory that the sun revolves around the earth. The existence of the antipodes and the revolution of the planet are susceptible of proof. The non-existence of the world of material things cannot be proved; and till a proof of its non-existence is supplied by philosophy, the belief of mankind will ever stand in the way of Idealism—Idealism can neither explain it, nor refute it, nor remove it.

Berkeley argues that the being of a Spirit infinitely powerful and wise and good is abundantly *sufficient* to explain all the appearances of nature (*Prin.* lxxii). Mill, in like manner, insists that ‘where there is a known cause adequate to account for a phenomenon there is no justification for ascribing it to an unknown one’ (*Exam.* 233). It is strange that two philosophers who deal so freely with the laws of human belief should appeal so confidently to the *Law of Parsimony*—the one to establish the existence of an ontologic fact, the other to establish the truth of the merest psychologic guess. It is true that entities are not to be

multiplied in vain. It is true that neither more nor more onerous causes are to be assumed than are necessary to account for the phenomena. That has been the language of philosophers from Hamilton to Occam. But this so-called law of parcimony is a mere regulative principle of thought ; it is not a law of logic, and still less is it a law of things. No one has contended more vigorously than Mill that a hypothesis is not to be received as probably true, merely because it accounts for all the known phenomena, when this is a condition which other hypotheses may satisfy as well (*Log.* ii. 20). Estimated by this standard, what is the value of the hypothesis that all our sensible ideas are inspired by God ? Grant that it accounts for all the phenomena of nature, there are other hypotheses which equally explain them. It possesses no claim upon our intellectual assent which is not equally possessed by the theories of Physical Influence, of Occasional Causes, of Pre-established Harmony, of the Vision of the Universe in God ; while these various theories possess at least one advantage over that of Berkeley, inasmuch as they do not bid defiance to the primeval instinct of the human race.

But the Law of Parcimony is a two-edged weapon in the hands of Berkeley. If we assume the existence of spirit as substance and as cause, why may we not regard *the Soul* as sufficient to account for all the appearances of nature ? Berkeley contends that ‘the ideas actually perceived by sense have no dependence on the will’ (*Prin.* xxix.

cxlvi). But this overlooks one of the most important of philosophical distinctions—that between spontaneity and volition. It is well known that far below the surface of consciousness and will, in the depths of our mental being, there are agencies at work which manifest their presence only by the effects which they produce. Our instincts, our tendencies, our appetites, affections and desires, our very capacities of receiving sensations from without, if indeed our sensations are to be regarded as determined from without, are instances of this. The principle is recognized by Berkeley himself as one of the fundamental principles of human knowledge. The conceptions of causality and substance are recognized by him as notions which form part of the necessary and yet spontaneous development of the intellect of man. Why, then, may not our sensible ideas be the necessary and yet spontaneous development of our capacities of sense? and why may not their very necessity be regarded as an indication of their subjective source? As Malebranche advanced half way to Berkeley by acknowledging our sensations to be caused by God, while he contended that our ideas of extension are perceived in Him; so Kant, advanced half way to Fichte, by insisting that our intuitions of space originate within, while he contended that our sensations are determined from without. But why may not the sensations which supply the matter, as well as the intuitions which supply the form, originate within? Why may not

the phenomena of sense be regarded as the mere spray and sparkle thrown up by some central fount of intuition? Why may not the Soul be regarded as the creator of the world, which, *ex hypothesi*, exists within? It is said the world is peopled. But if we believe in the existence of finite spirits, we believe as strongly in the existence of their material bodies; in fact, it is from believing in the existence of their material bodies that we believe in the existence of finite spirits. But as we might possess all the ideas which we possess, though no external bodies resembling them existed, so we might possess all the ideas which we refer to finite spirits, though there were no finite spirits in existence. Berkeley, in effect, concedes we might. It is God alone, he says, who maintains that intercourse between spirits, whereby they are able to perceive the existence of each other (*Prin.* cxlvii). But why should philosophy have recourse to God for this? A soul which could create the world within, and then project it outward, could surely people its creation. For what says Cudworth? "There is also another more interior plastic power in the soul, if we may so call it, whereby it is formative of its own cognitions, which itself is not always conscious of; as when, in sleep or dreams, it frames interlocutory discourses betwixt itself and other persons, in a long series, with coherent sense and apt connexions, in which oftentimes it seems to be surprised with unexpected answers and repartees, though itself were all the while the poet and inventor of the whole fable"

(*Works*, i. 247). See, then, how Berkeley's argument from dreams and frenzies recoils upon himself; see how the law of parcimony serves him. "From my own *being*," says Philonous, "and from the dependency I find in myself and my ideas, I do, by an act of reason, necessarily infer the existence of a God, and of all created things in the mind of God" (*Dial.* iii). But what are we to understand by necessary inference, by act of reason? Men cannot believe in the existence of a God more firmly than they believe in the existence of the world; and rejecting the most powerful of the spontaneous beliefs of humanity, Berkeley cannot consistently appeal to common sense. By necessary inference, therefore, he must mean either mathematical demonstration, or logical contradiction. That the mathematical method has no application in metaphysics is shown conclusively by Hume and Kant. Where then is the logical contradiction in the Egoistical doctrine, that there is originally but one substance, the Ego, and that in this one substance all possible accidents, all possible realities, are placed. If we may idealize matter, why may we not deify the mind? On the principles of Berkeley, there is no answer to Fichte when he relies on the law of parcimony; there is no answer even when he contends that the notion of God as a particular substance is contradictory and impossible (*Schwegler*, 274).

The Idealism of Berkeley is a bold effort to solve the mystery of existence—an ingenious guess at the

eternal riddle of the sphinx—an abortive attempt to lift the impenetrable veil. It gives philosophical expression to a vague and floating fancy which will ever haunt the intellects of subtle and refining men. But it is utterly incapable of proof, and it assumes principles which, if we follow them, conduct us to that vast abyss in which man sees nothing reflected but his ignorance and terror.

Compare for a moment the rival theories of Berkeley and Malebranche. The points of contact between the systems of these famous philosophers are many; and yet each point of contact suggests a point of contrast. Both of them believed that though the mind is conscious of nothing but its own ideas, it is able to reach the existence which lies beyond the sphere of self. But while the Oratorian recognized the existence of the three great ontological realities, the Anglican recognized the existence of but two. Both of them believed that the being and attributes of God are susceptible of demonstration. But while the Cartesian endeavoured to demonstrate these momentous facts from our idea of infinity, the follower of Locke endeavoured to demonstrate them from the existence and co-ordination of our sensible ideas. Both of them were devout believers in the infallible authority of revelation. But while the Catholic, following the tradition of his Church, clung to the literal interpretation of Scripture, and held that in the beginning God created the heavens and the earth; the Protestant, exercising his right of private judgment, adopted a different method of

interpretation, and held that the creation spoken of by Moses was a mere metaphysical creation. Each agreed that naturally we have no objective knowledge of the world of matter. But, while the one admitted its existence on the supposed authority of revelation, the other rejected its existence on the supposed authority of reason. Each admitted that, to explain the generation of our sensible ideas, we must have recourse to God. But while the one identified himself with God as the Universal Substance, the other recognized him rather as the Primeval Cause. Both agreed that God is the cause of our sensations. But while Malebranche, following the footsteps of Parmenides and Plato, identified our ideas of the primary qualities with the conceptions of the reason; Berkeley, pursuing the path of Protagoras, identified those ideas with sensation, and referred them exclusively to sense. Identifying all our sensible ideas with transient and mutable sensation, Berkeley regarded them all as modifications of the mind of man; identifying our ideas of the primary qualities with eternal and immutable conceptions, Malebranche regarded these as cognitions of the mind of God. Hence while the idea of Berkeley was a state of the mind of man subjectively produced by God, the idea, as distinguished from the sensation, of his rival was an act of the mind of God objectively perceived by man. The system of the one was, accordingly, the creation by God of an ideal universe in man; the system of the other was the vision by man of an actual universe in God.

But the moment that Malebranche thus attained reality, he was confronted by a perilous dilemma. Is the Divine idea numerically distinct from that of the human being who perceives it? The cognition of an act beyond the sphere of self is as difficult to realize as the cognition of a world of matter. Is the human idea identical with the divine? The world of matter, it is true, is gained, but forthwith the phantom of Pantheism stares us in the face. Nor did the Catholic philosopher recoil in the presence of the dreaded apparition. He believed in the impersonality of reason. He believed in the existence of the Universal Being. He held that God is the place of spirits, as space is the locus of material things. He held that in God we really lived, and moved, and had our being. And so the Vision of Malebranche dilated into Pantheism, and all human personality disappeared. The existence of God, it is true, was not lost in the hallucinations of self; but all self, all individuality, was lost in the abyss of God.\*

\* Il est absolument nécessaire que Dieu ait en lui-même les idées de tous les êtres qu'il a créés, puisqu' autrement il n'aurait pas pu les produire, et qu'ainsi il voit tous ces êtres en considérant les perfections qu'il renferme, auxquelles ils ont rapport. Il faut de plus savoir que Dieu est très-étroitement uni à nos âmes par sa présence, de sorte qu'on peut dire qu'il est *le lieu des esprits*, de même que les espaces sont en un sens le lieu des corps. Ces deux choses étant supposées, il est certain que l'esprit peut

voir ce qu'il y a dans Dieu qui représente les êtres créés, puisque cela est très-spirituel, très-intelligible et très-présent à l'esprit. Ainsi l'esprit peut voir en Dieu les ouvrages de Dieu, supposé que Dieu veuille bien lui découvrir ce qu'il y a dans lui qui les représente (*Rech. L. iii. P. ii. c. vi.*)

Ce qu'ils voient en Dieu est très-imparfait, et Dieu est très-parfait. Ils voient de la matière divisible, figurée, etc., et en Dieu il n'y a rien qui soit divisible ou figuré; car *Dieu est tout être*, parce qu'il est infini et

Berkeley endeavoured to avoid the precipice which overhangs the Pantheistic gulf, but the path which his philosophy pursued lay in an equally perilous direction. Whatever the result of his philosophy may be, Malebranche, at all events, accomplished his original design. He shared in the divine intelligence; he incorporated himself with the divine substance; he became part of God. In doing this he transcended himself; he grasped reality; he attained the object. Berkeley attempted to reach external existence by the principle of causality. But the principle of causality is, at best, a mere principle of reason; and a principle of reason is essentially subjective; and how can a subjective principle give us an objective fact? The eagle, however powerful his pinion, cannot soar out of, cannot outsoar, himself. The mind, however powerful its principles, cannot, by their aid alone, transcend the mind. Let it mount into the heavens, or plunge into the abyss, it is still the soul, and nothing but the soul—the soul concentrated in itself and its beliefs. It may *believe*, but what is the value of belief on the principles

qu'il comprend tout; mais il n'est aucun être en particulier. Cependant ce que nous voyons n'est qu'un ou plusieurs êtres en particulier; et nous ne comprenons point cette simplicité parfaite de Dieu qui renferme tous les êtres (*ibid.*).

The resemblance between the system of Malebranche and that of Spinoza was the subject of a correspondence between Malebranche and Dortous de Mairan. Malebranche ex-

pressed himself horrified at the idea that any resemblance between the two systems should be detected. But as M. Simon remarks: 'Avait-il quelque conscience confuse des rapports de sa philosophie avec celle de Spinoza? Ou cette profonde horreur venait-elle seulement de l'existence d'une analogie qui l'irritait contre Spinoza sans qu'il en reconnût le motif?'

The words with which M. Simon closes his Introduction to his edition

of Berkeley? Repudiating the belief in matter, and reducing it to a mere series of sensations—repudiating the belief in space, and reducing it to the mere absence of resistance—repudiating the belief in time, and reducing it to the mere succession of ideas—how can Berkeley, with any degree of plausibility, insist on the belief that every quality must be supported by a substance, and that every change must be produced by an efficient cause? But even if the validity of the principles of substance and causation be conceded—if it be conceded that the soul is at once a substance and a cause—the concession is in vain. The being of a Spirit powerful, and wise, and good may be sufficient to account for all the phenomena presented to the mind; but then comes the Egoist, with his irreverent and inexorable law. You have the principle of causality—why postulate the existence of any cause beyond yourself? If the soul can create the world, and people it with finite spirits, why may not it create the Infinite himself? The Infinite is the mere imagination of the finite—God, like the giant phantom of the Hartz, is the mere

of the works of Malebranche, are equally applicable to Berkeley, who, notwithstanding the vast stimulus which he has given to speculation, has been assailed by the same shallow wit which said of Malebranche—

He who in God sees all things pass,  
Sees he not there that he's an ass?

Un méchant vers de Faydit—

Lui qui voit tout en Dieu,  
N'y voit pas qu'il est fou?

eut une fortune immense. Il est com-

mode pour le vulgaire de se débarrasser ainsi du fardeau de l'admiration, et d'avoir pitié des hommes de génie! Ce fou de Malebranche est une de nos grandes gloires nationales; ses visions métaphysiques sont une école de sagesse et de profonde philosophie, et plaise à Dieu, pour l'honneur de la philosophie et les progrès de l'esprit humain, qu'il puisse naître encore des rêveurs comme lui! (*Oeuvres de Malebranche*, i. 27).

self-projection of the soul—God is nothing but the moral order. Here, then, we find ourselves at the opposite end of the diameter of thought. Flying from Malebranche, we are met by Fichte. The Pantheism of the one philosopher is exchanged for the Panegoism of the other. The world of matter fades into a dream; all finite spirits vanish; God is a mere vision of the night; and the soul is left the solitary of the universe—the universe is absorbed in self.

But even this utter desolation is not the end. The substantial existence of the soul is inferred by Berkeley from the principle of substance, just as the existence of God is inferred by him from the principle of causation. But if the finite spirit is a substance, the infinite spirit is a substance also; and this suggests a problem the existence of which Berkeley does not seem to have suspected. What is the relation of the two substances, which in kind are one? Is the finite substance part and parcel of the infinite? We then have a single absolutely infinite substance, but it is the substance of Spinoza. Is the finite substance additional to the infinite? The infinite then ceases to be infinite, and we are involved in a contradiction more dangerous than any attributed to Newton. But what is true of the principle of causality is true of the principle of substance also; it is only a belief insisted on by one who disregards beliefs. In fact Berkeley admits that it will be found no easy task to abstract the *existence* of a spirit from its *cogitation* (*Prin.* xcviij).

Here, then, the theological idealist reaches the position where Hume and Hegel are entrenched, and proclaims the identity of thought with being. In the system of Berkeley this element lies latent; but in the system of Hume it is evolved, developed, and avowed. Hume denies the existence, not only of corporeal, but of incorporeal substance (*Works*, i. 33). He maintains that 'the idea of existence is the very same with the idea of what we conceive to be existent' (i. 96). He holds that 'our perceptions may exist separately, and have no need of anything else to support their existence' (i. 299). He boldly asserts that man is 'nothing but a bundle or collection of different perceptions, which succeed each other with an inconceivable rapidity, and are in a perpetual flux and movement' (i. 321). It is true that, in his *Essays*, the work which he expressly desired to be regarded as alone containing his philosophical opinions, he does not repeat these various assertions. But his earlier creed has survived him, and is the creed of his disciples. Following in the footsteps of Berkeley, Mill defines matter to be a permanent possibility of sensation (*Exam.* 233); following in the footsteps of Hume, he defines mind to be a permanent possibility of feeling (p. 241). Claiming to be a Berkeleian, he discards the ministering principles of the philosophy of Berkeley, causality and substance. He accepts the doctrine that the mind is a mere series of sensations—a series which is destitute of substance—a thread of consciousness,

which, though it may be prolonged for ever, is not a thread, but an abstraction (*Exam.* 246).

This, then, is the result in which the philosophy of Berkeley ends. The philosophy which was to banish atheism, and idolatry, and irreligion from the world; the philosophy which was to renovate the sciences, which was to purify morals, which was to spiritualize religion, which was to bring man face to face with God—this high and aspiring philosophy but ends in this. Denying all objective knowledge of existence, it restricts itself to the region of belief; denying the most powerful of beliefs, it enters upon the desert waste of speculation, with no guide but the wandering gleam, the *ignis fatuus* of fancy. Led by this delusive light, it glides past the Pantheism of Malebranche; it traverses the Panegoism of Fichte; it ends in the Nihilism of Mill. Bereft of all metaphysical aid, it sees nothing in the world but self; in self it sees nothing but sensation. It beholds all reality, all existence, fade away. It recognises nothing but images, which are images of nothing. The conception of the poet is realised—

And Nought is everything, and everything is Nought.

*Haec autem est una contentio quae adhuc permanserit ; nam illud, nulli rei assensurum esse sapientem nihil ad hoc controversiam pertinebat ; licebat enim nihil percipere et tamen opinari, quod a Carneade dicitur probatum. —CIC. ACAD. ii. 24.*

WHEN David Hume, at the age of twenty-seven, was concluding the Treatise which contained the germ of the Kritik of the Pure Reason, he professed himself to be affrighted and confounded with the forlorn solitude in which he was placed by his philosophy. He fancied himself some strange, uncouth monster, who had been expelled all human converse, and left utterly abandoned. “Everyone keeps at a distance,” he said, “and dreads the storm which beats upon me from every side. I have exposed myself to the enmity of all metaphysicians, logicians, mathematicians, and even theologians ; and can I wonder at the insults I must suffer ? I have

declared my disapprobation of their systems; and can I be surprised if they should express a hatred of mine, and of my person? When I look abroad, I foresee on every side dispute, contradiction, anger, calumny, and detraction" (*Works*, i. 335).

Never was expectation more fully realized; never was prophecy more literally fulfilled. It is true that the *Treatise of Human Nature*, like the *Kritik of the Pure Reason*, fell apparently 'dead-born' from the press. It is true that, to take Hume's own account of the matter, it did not even reach such distinction as to excite a murmur among 'the zealots.' But the dead birth of the new philosophy was only a case of suspended animation, and the absence of the murmur was only the prelude to the storm. Never since the days when, in the words of Warburton, the whole Church militant was thundering on the steel cap of the philosopher of Malmesbury, had there been developed so fierce a manifestation of general dislike as was roused by the philosophy of Hume. The effect on the fortunes of the philosopher was injurious enough. He was denounced before the General Assembly of the Church of Scotland. He was rejected as a candidate for the Chair of Morals in the University of Edinburgh. He was compelled to resign his appointment of Librarian to the Faculty of Advocates. Even his fast friend, Lord Hertford, was afraid to take him to Ireland when he was appointed to the Lord Lieutenancy, and left the obnoxious philosopher as Secretary of the Embassy at Paris.

Among the Parisian freethinkers and fine ladies, Hume, to use his own description of his course of life, ate nothing but ambrosia, drank nothing but nectar, breathed nothing but incense, and trod on nothing but flowers. But among his own countrymen, again to use his own expression, he was looked on as a monster. As the type of the sentiments with which he was regarded by his contemporaries, we may take Johnson and the literary circle of which he was the centre. The contemptuous language in which Johnson habitually indulged, when speaking of him, is familiar to every reader of Boswell. The philosopher, whom Reid acknowledged as his master, and who aroused Kant from his dogmatic slumber, was derided as a mere sciolist. He was a shallow fellow, a vain creature, a mere imitator of Voltaire. He was an enemy of the human race, from whom all the courtesies of controversy might be lawfully withheld. He was to be jostled down as a chimney-sweep; he was to be knocked on the head like a highwayman; he was to be treated with as little ceremony as a detected debauchee. He had only *lumières* enough to light him on his way to hell. This was the language habitually employed by the most eminent literary man of the age, when speaking of the philosopher who was known in foreign society as 'the good David,' who was delineated by Mackenzie as 'the good La Roche,' who was acknowledged even by Boswell to be better than his books, and who was said by the author of the *Wealth of Nations* to have approached as nearly

to the ideal of a perfectly wise and good man as the imperfection of humanity would permit.

Nor has Hume's philosophy escaped the detraction to which his character has been exposed. The great thinker, who determined the whole subsequent development of European thought, has been described as a paradoxical philosopher, who believed that there could be no belief. Upon the principles he borrowed from Locke and Berkeley, Hume, according to Reid, reared a system of absolute scepticism, which leaves no rational ground to believe any one proposition rather than its contrary (*Works*, 295). Hume, says Stewart, ended where Descartes began, and considered no one proposition as more certain, or even as more probable, than another (*Works*, i. 437). The great speculator, says Mackintosh, aimed at proving that from the structure of the understanding we are doomed for ever to dwell in absolute and universal ignorance (*Works*, i. 136). In fact, the scepticism attributed to Hume by the Scottish School was that which the doctor expounds to Sganarelle:—Notre philosophe ordonne de ne point énoncer de proposition décisive, de parler de tout avec incertitude, de suspendre toujours son jugement. Sir William Hamilton, it is true, offers to explain away this ultra-Pyrrhonian doubt. "Hume," he says, "as a legitimate sceptic, could not assail the foundations of knowledge in themselves; his reasoning is from their subsequent contradiction to their original falsehood; and his principles, not established by himself, are accepted only as princi-

ples universally conceded in the previous schools" (*Disc.* 87). But even this, as we shall see, involves an error as palpable as that of Mackintosh, of Stewart, and of Reid. The only member of the Scottish school who seems to have formed any just conception of the scope of Hume's philosophy was Brown. On the question of the existence of an external world he saw that Hume was, in reality, at one with Reid (*Works*, ii. 89). But even Brown should have gone still further, for it may be demonstrated that on all the leading questions of philosophy Hume was in reality at one with Kant.

The *Treatise of Human Nature* was principally composed at La Flèche—the little town in Anjou, in the Jesuits' College of which Descartes received his education. Planned before he was twenty-one, composed before he was twenty-five, and published before he was twenty-seven, the *Treatise* anticipating, as it does, the problem, the method, the solution, and the results, which Kant proclaimed in the *Kritik* at the age of sixty, must ever be regarded as one of the miracles of precocious genius. The leading doctrines of the *Treatise of Human Nature*, as is well known, were subsequently reproduced in the *Inquiry concerning Human Understanding*, which Hume, in his advertisement, desired might be regarded as alone containing his philosophical sentiments and principles. But the general complexion of the two productions is the same—qualis decet esse sororum—and the elder bears the palm. The *Treatise* is immortal, though disowned. It em-

bodies one of the permanent types of philosophical opinion. Men may differ as to the justice of the conclusions at which it arrived; but its importance is to be estimated by the influence which it exerted rather than by the information which it conveyed. It imparted a stimulus more powerful than science. Its dogmatism dispelled the idealistic dreams of Reid. Its scepticism disturbed the dogmatic sleep of Kant. Its attempt to construct a universe of thought without any metaphysical admixture is the true antecedent of the absolute of Hegel. And, finally, its nihilistic idealism, and empirical conception of geometry, repudiated by Hume himself in his *Inquiry*, have, in our own time, been revived and offered to the world as a discovery in philosophy by Mill.

It is by a comparison with Kant that the true philosophical position of Hume is best determined. Paradoxical as the assertion may appear, until it is shown to be the truth, Hume was to Kant what Quesnai was to Smith, and what Copernicus or Kepler was to Newton. With inferior powers of analysis, with less genius for system, with a lower tone of enthusiasm, and with a feebler interest in science, Hume rivalled his illustrious successor, in the clearness of his insight into the nature of the problem to be solved, and the justness of his conception of the method of solution. In every direction he approached, and on many of its most important points he actually reached, the position which was assumed by Kant. In fact his *Treatise of Human*

Nature may be described as the *Kritik* of the Pure Reason in its rudimentary and undeveloped state. It was the *premier ébauche* of that great design; and, if it had proceeded from the same author, might be considered in the same light (to borrow a metaphor from an early and forgotten critic of the *Treatise*) as a juvenile work of Milton, or the first manner of Raphael, compared with the masterpieces of their genius when matured by time.

The tone of sad but lofty eloquence with which Kant commences his *Kritik* of the Pure Reason is familiar to every student of philosophy. Metaphysics, once the queen of the sciences, he said, had been deposed. Like Hecuba—*modo maxima rerum*—she was condemned to poverty and exile. Like Rome, once the mistress of the world, she had been destroyed by internecine feuds, and was the spoil of the barbarians. She was the object of universal indifference, contempt, and scorn. With an eloquence less lofty, and perhaps with a feeling less profound, the predecessor of Kant indulges in a strain of similar reflection. Philosophy, he said, was in a most unsatisfactory condition. The very rabble out of doors might judge, from the noise and clamour which they heard, that all was not going well within (i. 5). The victory in the field of speculation was not gained by the men-at-arms, but by the trumpeters and drummers of the army (i. 6). The philosophers, like the angels, had covered their eyes and obscured their vision with their wings (i. 339). Popular superstitions, like robbers chased from the

open country, had fled into the forest, and lay in wait to break in upon every unguarded avenue of the mind (iv. 10). But Hume, like Kant, perceived that the metaphysical spirit was immortal in the mind of man. It was vain, he said, to hope that men, from frequent disappointment, would abandon such airy speculations (iv. 10). The motive of blind despair could have no place in science. Every adventurous genius would find himself stimulated, rather than discouraged, by the failure of his predecessors (iv. 11). "The only expedient from which we can hope for success in our philosophic researches," he says in the *Treatise*, "is to leave the tedious, lingering method, which we have hitherto followed, and instead of taking now and then a castle or village on the frontier, to march up directly to the capital or centre of these sciences, to human nature itself; which being once masters of, we may everywhere else hope for an easy victory" (i. 8). "The only method of freeing learning at once from these abstruse questions," he says in his later work, "is to inquire seriously into the nature of human understanding, and show, from an exact analysis of its powers and capacity, that it is by no means fitted for such remote and abstruse subjects" (iv. 11). It is only 'after deliberate inquiry' that we can reject 'the most uncertain and disagreeable part of learning' (*ibid.*); and 'we must submit to this fatigue,' he says, anticipating the very words of Kant, 'in order that we may live at ease for ever after' (*ibid.*).

It is true that a dissertation upon the absolute necessity of self-examination as the preliminary step in mental science was no novelty in the history of thought. Bacon had insisted on a thorough purification of the intellect, before the marriage of the rational and the empirical faculties could be celebrated for the glory of God and for the benefit of man. Hobbes had proclaimed that philosophy, the child of the world and the mind, was all within; and that it was the function of the thinker, as it was that of the statuary, to remove the superfluous mass, and not to make the image, but to find it. Locke, with still greater distinctness, had enounced the true method of philosophical inquiry; and his sense of its importance had suggested the composition of his immortal Essay. He had seen that the first step towards satisfying the curiosity of man, in the remote inquiries into which it was so apt to run, was to take a view of the understanding, to examine its powers, and to ascertain the subjects to which it was adapted. It was in vain, he said, that we let loose our thoughts into the vast ocean of being; it was in vain that we chased the horizon of knowledge, that ever fled before us. Our prime object should be to consider the capacities of our understandings; to discover the extent of our knowledge; to determine the line which sets the bound between the dark and the enlightened parts of things, between what is and what is not comprehensible by us; and we should then with less scruple acquiesce in the avowed ignorance of the one, and employ

our thoughts and discourse with more advantage and satisfaction on the other.

In his examination of human nature, the first thing which attracted the observation of Hume was the profound difference which subsists between its practical and its speculative interests. 'Nature, by an absolute and uncontrollable necessity,' he says in the *Treatise*, when speaking of Scepticism with regard to Reason, 'has determined us to judge, as well as to breathe or feel; nor can we any more forbear viewing certain objects in a stronger and fuller light, upon account of their customary connexion with a present impression, than we can hinder ourselves from thinking, as long as we are awake, or seeing the surrounding bodies, when we turn our eyes towards them in broad sunshine.' 'Whoever has taken the pains to refute the cavils of this total scepticism,' he adds, 'has really disputed without an antagonist, and endeavoured by arguments to establish a faculty, which nature has antecedently implanted in the mind, and rendered unavoidable' (i. 240). His view of Scepticism with regard to the Senses is as clear as his view of Scepticism with regard to Reason. 'The sceptic,' he says, 'still continues to reason and believe, even though he asserts that he cannot defend his reason by reason; and by the same rule he must assent to the principle concerning the existence of body, though he cannot pretend, by any arguments of philosophy, to maintain its veracity. Nature has not left this to his choice, and has doubtless es-

teemed it an affair of too great importance to be trusted to our uncertain reasonings and speculations. We may well ask, what *causes* induce us to believe in the existence of body? but it is in vain to ask whether there be body or not. That is a point which we must take for granted in all our reasonings' (i. 245). This distinction of itself dispels a cloud of error. It shows that the Scepticism of Hume is not the contradiction of Mackintosh—'a belief that there can be no belief' (*Works*, i. 137); for the utmost it can be reduced to is a belief that there can be no knowledge. It shows, moreover, that a considerable portion of the subsequent philosophy of common sense and natural belief was a mere *ignoratio elenchi*. Hume himself defines his philosophical position. 'My practice you say refutes my doubts,' he says, in speaking of our belief in what is called the uniformity of nature—'but you mistake the purport of my question. As an *agent*, I am quite satisfied in the point; but as a *philosopher*, who has some share of curiosity—I will not say scepticism—I want to learn the foundation of this inference' (iv. 47).

But in point of fact Hume does not even entertain the belief that there can be no knowledge; for nothing can be more dogmatic than the tone which he adopts when, as a philosopher, he proceeds to lay the foundations of his system. 'It cannot be doubted,' he says, 'that the mind is endowed with several powers and faculties; that these powers are distinct from each other; that what is really dis-

ting to the immediate perception may be distinguished by reflection ; and consequently that there is a truth and falsehood in all propositions on this subject, and a truth and falsehood which lie not beyond the compass of human understanding' (iv. 12). Nor did Hume despair of discovering the laws to which our mental phenomena are subjected. Astronomers, he said, had long contented themselves with proving, from the phenomena, the true motions, order, and magnitude of the heavenly bodies, till a philosopher at last arose who seems, from the happiest reasoning, to have at last determined the laws and forces by which the revolutions of the planets are governed and directed. The like, he said, had been performed with regard to other parts of nature ; and there was no reason to despair of equal success in our inquiries concerning the mental powers and economy, if prosecuted with equal capacity and caution (iv. 14).

In investigating the domain of Human Nature, Hume occupies the idealist position at the very outset. "It is universally allowed by philosophers," he says, "and is, besides, pretty obvious in itself, that nothing is ever really present with the mind but its perceptions, or impressions and ideas, and that external objects become known to us only by those perceptions they occasion" (i. 97). And he does not shrink from the logical consequence of this. "Since nothing," he says, "is ever present to the mind but perceptions, and since all ideas are derived from something antecedently present to the

mind, it follows that it is impossible for us so much as to conceive or form an idea of anything specifically different from ideas and impressions. Let us fix our attention out of ourselves as much as possible; let us chase our imagination to the heavens, or to the utmost limits of the universe; we never really advance a step beyond ourselves, nor can conceive any kind of existence but those perceptions which have appeared in that narrow compass. This is the universe of imagination, nor have we any idea but what is there produced" (i. 97).

Such being the universe of imagination, let us see how Hume proceeds to determine the 'mental geography' of this ideal realm. All the perceptions of the human mind, he says, resolve themselves into two distinct kinds, which he calls impressions and ideas (i. 15). By the term *impression*, he would not be understood to express the manner in which our lively perceptions are produced in the soul, but merely the perceptions themselves (i. 16). These impressions might be divided into two kinds, those of sensation and those of reflection (i. 22). "The first kind," he says, "arises in the soul originally, from unknown causes—the second is derived in a great measure from our ideas" (*ibid.*). An impression first strikes upon the senses—of this impression there is a copy taken by the mind, and this we call an *idea*—the idea, when it returns upon the soul, produces passions, emotions, and desires, which may be called impressions of reflection—these, again, are copied by the memory and imagination, and become

ideas (*ibid.*). Ideas are thus the copies of impressions. This is the cardinal point of Hume's philosophy. "Every one," he says, "may satisfy himself in this point by running over as many ideas as he pleases. But if anyone should deny this universal resemblance, I know no way of convincing him but by desiring him to show a simple impression which has not a corresponding idea, or a simple idea which has not a corresponding impression. If he does not answer this challenge, as it is certain he cannot, we may, from his silence and our own observation, establish our conclusion." "The full examination of this subject," he says, "is the subject of the present treatise; and therefore we shall here content ourselves with establishing one general proposition—That all our simple ideas, in their first appearance, are derived from simple impressions, which are correspondent to them, and which they exactly represent" (i. 18).

In professing to have established this general proposition, Hume, it is evident, is so far from sceptically accepting his premises from Locke, that he dogmatically rejects one of Locke's most important doctrines. Locke, it is true, holds that the simple ideas, which are the 'materials' of our knowledge, are suggested and furnished by sensation and reflection; but he also recognizes certain relative ideas, such as those of substance and causation, which are 'superadded' to these materials by the action of the understanding, and which, in his controversy with Stillingfleet, he terms 'rational ideas.' But Hume

refused to follow Locke in this. He dogmatically lays it down as an 'obvious principle' that 'reason alone can never give rise to any original idea,' and this dogma determined the whole subsequent course of his philosophy, and constitutes its most conspicuous blemish.

Mr. Hodgson, in his *Metaphysical Essay on Time and Space*, attributes to Hume the merit of being one of those philosophers who have kept closest to phenomena themselves, without mixing up with their analysis any considerations of their possible origin or causes; but in doing this, he says, he produced a picture of the universe as if it were 'unconnected,' 'incoherent,' and 'the work of chance'; and this was especially the case with his theory of causation (p. 33). Curiously enough, Hume anticipated this very objection, and was most anxious to avert its force. "Were ideas entirely loose and unconnected," he says, "*chance* alone would join them; and it is impossible the same simple ideas should fall regularly into complex ones, as they commonly do, without some bond of union among them, some associating quality, by which one idea naturally introduces another" (i. 26).

The faculty by which our simple ideas are combined is the *Imagination*; and the principles of association by means of which it combines them are resemblance, contiguity, and causation (i. 26). "It is plain," says Hume, "that in the course of our thinking, and in the constant revolution of our

ideas, our imagination runs easily from one idea to any other that resembles it, and that this quality alone is to the fancy a sufficient bond and association. It is likewise evident that as the senses, in changing their objects, are necessitated to change them regularly, and take them as they lie contiguous to each other; the imagination must, by long custom, acquire the same method of thinking, and run along the parts of space and time in conceiving its objects. As to the connexion of cause and effect we shall have occasion afterwards to examine it to the bottom, and therefore shall not at present insist upon it" (i. 27). "Here," says Hume, "is a kind of attraction, which in the mental world will be found to have as extraordinary effects as in the natural"—"its effects are everywhere conspicuous; but as to its causes, they are mostly unknown, and must be resolved into original qualities of human nature, which I pretend not to explain" (i. 29).

But in Hume's philosophy, as in Kant's, the work of the imagination is only preliminary to the work of the *Understanding* proper. "Among the effects of this union or association of ideas," he says, "there are none more remarkable than those complex ideas, which are the common subjects of our thoughts and reasoning, and generally arise from some principle of union among our simple ideas" (i. 29). These complex ideas, following the example of Locke, he divides into modes, substances, and relations (*ibid.*). Modes are artificial and arbi-

trary combinations (i. 34). 'The idea of a substance is nothing but a collection of simple ideas that are united by the imagination,' and are 'supposed to be closely and inseparably connected by the relations of contiguity and causation' (i. 33). This is evidently Kant's synthesis of the imagination. But if anyone wishes to see how nearly Hume approached the Kantian position, we must examine his analysis of philosophical relations.

"It may, perhaps, be esteemed an endless task," says Hume, "to enumerate all those qualities which make objects admit of comparison, and by which the ideas of *philosophical relation* are produced" (i. 30). "But," he continues, "if we diligently consider them, we shall find that, without difficulty, they may be comprised under seven general heads, which may be considered as the sources of all philosophical relation" (*ibid.*). These seven general heads are Resemblance—Identity—the relations of Space and Time—the relations of Quantity and Number—the relations of Quality and Degree—the relation of Contrariety—and the relation of Causes and Effects (i. 30, 98). These relations are the *Categories* of Hume. The defects of his analysis are patent. It is guided by no definite preconception. It mingles analytic principles such as identity and contrariety with synthetic principles, such as quantity and quality and relation proper. It makes no distinction between the forms of space and time and the categories of substance and causation. It excludes substance from the list of relations, and treats of it

under an independent head.\* But it is quite evident that, whatever may be its defects, this analysis of philosophical relations contains the germ of Kant's Analytic of Conceptions, and that the relations of Hume are the categories of Kant in their rudimentary or embryo condition.

But Hume not only gives an Analytic of Conceptions—he gives an Analytic of the Principles in which they are embodied. In his chapter on *Knowledge* he divides the seven relations into two classes—‘into such as depend entirely on the ideas which we compare together, and such as may be changed without any change in the ideas’ (p. 98). If we follow out this distinction, “it appears,” he says, “that of these seven philosophical relations there remain only four which, depending solely on ideas, can be the objects of knowledge and certainty. These four are resemblance, contrariety, degrees in quality, and proportions in quantity and number. Three of these relations are discoverable at first sight, and fall more properly under the province of intuition than demonstration” (i. 99), which, as we shall see, is restricted to the relations of quantity and number (iv. 190). “This,” says Hume in his chapter on *Probability*, “is all I think necessary to observe concerning those four relations which are the foundation science; but as to the

\* Kant, however, admits that substance is to be regarded as a category, not because it is itself relative, but because it is the condition of relation

(p. 140); and he also admits that substance is more easily recognized through the conception of action than through that of permanence (p. 151).

other three, which depend not on the idea, and may be absent or present while that remains the same, it will be proper to explain them more particularly. These three relations are identity, the situations in time and place, and causation" (i. 103). Of these the most important is causation, for "it is only causation which produces such a connexion as to give us assurance from the existence or action of one object that it was followed or preceded by any other existence or action. Nor can the other two relations ever be made use of in reasoning, except so far as they either affect or are affected by it" (i. 104). With reference to the principles thus established, Hume gives a second challenge to philosophers—to adduce any proposition which is intuitively certain besides those which he admits. "Anyone who would assert it to be intuitively certain," he says, "must deny these to be the only infallible relations, and must find some other relation of that kind to be implied in it, which it will then be time enough to examine" (i. 110).

It is evident from this that while Hume rejects what is roughly called Locke's Theory of the Origin of Ideas, he accepts his Theory of the Origin of Knowledge, which distinguishes between certain and universal knowledge on the one hand, and experimental knowledge on the other (iv. iii. 29), and which bases the latter on 'experience' and refers the former to 'intuitive evidence' and to 'reason' (iv. xii. 9). But whether we have regard to our conceptions or to the principles which they suggest,

whether we consider Hume's theory of ideas or his theory of knowledge, Locke's philosophy supplies an answer to the double challenge of Hume, and shows at once that all our ideas are not copied from our impressions, and that the relations of quantity and number are not the only principles of which we may be intuitively certain.

Of the creatures and inventions of the understanding which were recognised by Locke, he places in the forefront of his philosophy the idea of *Substance* which all our ideas of substances suppose. "When we talk or think of any particular sort of corporeal substances," he says, "though the idea we have of them be but a complication or collection of those several simple ideas of sensible qualities which we used to find united in the thing," yet, "because we cannot conceive how they should subsist alone, nor one in another, we suppose them existing in, and supported by, some common subject" (ii. xxiii. 4). This was the supposition of we know not what, which in the Indian story underlay the tortoise which supported the elephant which sustained the world (s. 2). All this was foolishness to Hume. "The opinions of the philosophers about substance and accident," he said, "are like the spectres in the dark, and are derived from principles which, however common, are neither universal nor unavoidable in human nature" (i. 290). 'We have no idea of substance' he said, 'distinct from that of a collection of particular qualities' (i. 33). He repeats his challenge. "I desire those

philosophers," he says, "who pretend we have an idea of the substance of our minds, to point out the impression that produces it, and tell distinctly after what manner that impression operates, and from what object it is derived" (i. 298). His "conclusion" is "that since all our perceptions are different from each other, and from everything else in the universe, they are also distinct and separable, and may be considered as separately existing, and may exist separately, and have no need of anything else to support their existence" (i. 299).

Or take the idea of *Causation*, which plays as prominent a part in the philosophy of Hume as the idea of substance does in that of Locke. According to Hume, every impression of sensation 'arises in the soul originally from unknown causes' (i. 22). This is a recognition of the non-sensuous cause of our sensations, the *nescio quid* of Kant. How, then, does Hume account for the idea of *Efficient Causes*? Hume is undoubtedly entitled to the credit of seeing that, as far as the external senses are concerned, we only find that one fact is followed by another (iv. 74). He is entitled to the credit of having shown, by an exhaustive analysis, that we have no intuition of efficiency, either in the consciousness of motion, or in the consciousness of effort, or in the consciousness of volition, whether exerted on the object, or the organ, or the will (*ibid.*). But why may we not form the conception of an efficiency of which we have no intuition? Hume's challenge to the philosophers was 'to show a simple impression

which has not a corresponding idea, or a simple idea which has not a corresponding impression' (i. 18). The philosopher produces the conception—the simple idea, as Hume calls it—of efficient cause. Again, what is Hume's reply? "As we can have no idea of anything which never appeared to our outward sense or inward sentiment," he says, "the necessary conclusion seems to be, that we have no idea of connexion and power at all, and that these words are absolutely without any meaning whatsoever" (iv. 87). Hume challenges the philosophers to produce any proposition that is intuitively certain besides those of mathematics. The philosopher produces the principle which asserts that whatever began to exist must have a cause of existence; and Hume replies, that 'anyone who would assert it to be intuitively certain must deny these to the only infallible relations,' which are unalterable so long as the ideas to which they relate remain the same (i. 110). Here it is evident that Hume only eludes his adversary by shifting in a circle. "I believe," says Hume, referring to Locke's celebrated chapter upon Power, "that the most general and most popular explication of this matter is to say, that finding from experience that there are several new productions in matter, such as the motions and variations of body, and concluding there must somewhere be a power capable of producing them, we arrive at last, by this reasoning, at the idea of power and efficiency" (i. 208). "But," says Hume, "to be convinced that this explication is more popular than

philosophical, we need but reflect on two very obvious principles :—*first*, that reason alone can never give rise to any original idea ; and *secondly*, that reason, as distinguished from experience, can never make us conclude that a cause or productive quality is absolutely requisite to every beginning of existence” (i. 209, 227).

Whether any particular intelligence can conceive a collection of qualities as existing without essential substance, or can conceive the collection as beginning to exist without an efficient cause, is one of those questions which that particular intelligence must determine for itself. Locke found himself unable to form such a conception, and recognized substance and causation as ‘relative ideas.’ Berkeley found himself unable to form such a conception, and admitted substance and causation into his philosophy as ‘notions.’ Hume protested he could conceive what was inconceivable to Berkeley and to Locke. Rejecting the Berkeleian notion, he consistently rejected the Berkeleian theory in both its aspects. Ignoring the conception of efficiency, he saw no necessity for ascribing our ideas to the Deity as *cause* ; and ignoring the conception of inherence, he saw no necessity for looking on the mind as the *substance* in which ideas must subsist.

In thus confining himself to the phenomena of the mind, analyzing their laws, and excluding all consideration of their efficient causes and of their subjects of inherence, Hume developed a system of psychological idealism without any metaphysical

admixture whatsoever. Recognizing nothing in the world but mind, and recognizing nothing in the mind but a system of perceptions, he regarded perception as the sole existence. "There is no impression nor idea of any kind of which we have any consciousness or memory," he says, "that is not conceived as existent; and it is evident that, from this consciousness, the most perfect idea and assurance of *being* is derived" (i. 95). "From hence," he continues, "we may form a dilemma, the most clear and conclusive that can be imagined, viz., that since we never remember any idea or impression without attributing existence to it, the idea of existence must either be derived from a distinct impression, conjoined with every perception or object of our thought, or must be the very same with the idea of the perception or object" (*ibid.*). His determination is, that "the idea of existence is the very same with the idea of what we conceive to be existent" (i. 96). He thus reaches the conclusion which Parmenides, from a different starting-point, had reached—

ταῦτόν δ' ἐστὶ νοεῖν τε καὶ οὐνεκὲν ἐστὶ νόημα.

He teaches the doctrine which was taught by Plotinus in the Alexandrian schools. He anticipates, in fine, the famous postulate of Hegel, and proclaims the identity of thought and being.

But if being is identical with thought, the greater is the necessity for thinking. If the ideas of body, which form so large a portion of the sys-

tem of perceptions, which is called the mind, are mere 'collections,' there must be some process of thinking to collect them. If the mind is but a system of perceptions linked together by the relation of cause and effect, even in its mere psychological aspect, that relation must be thought. Nor does Hume evade his obligations in this respect, for the main characteristic of his philosophy is his theory of *Physical Causation*. It is here that he is most conspicuously on the track of Kant. He anticipates the Kantian view in stating that "the only relation that can be traced beyond our senses, and informs us of existence and objects which we do not see or feel, is causation" (i. 104)—that "it is only causation which produces such a connexion as to give us assurance from the existence or action of one object that it was followed or preceded by any other existence or action" (*ibid.*). He anticipates the Kantian view in stating that the relation of cause and effect is the only relation which involves the idea of a 'necessary connexion' (i. 206). Again he anticipates the Kantian view when he proclaims that this idea of necessary connexion can never be discovered in the object. "I turn the object on all sides," says Hume, "in order to discover the nature of this *necessary connexion*, and find the impression, or impressions, from which its idea may be derived. When I cast my eye on the known qualities of objects, I immediately discover that the relation of cause and effect depends not in the least on *them*. When I consider their relations, I can find none but

those of contiguity and succession, which I have already regarded as imperfect and unsatisfactory. Shall the despair of success make me assert that I am here possessed of an idea, which is not preceded by any similar impression? This would be too strong a proof of levity and inconsistency; since the contrary principle has been already so firmly established as to admit of no further doubt, at least, till we have more fully examined the present difficulty" (i. 108).

Hume accordingly devotes himself to the investigation of the origin of this idea. In this investigation he resolves to "proceed like those who, being in search of anything that lies concealed from them, and not finding it in the place they expected, beat about all the neighbouring fields, without any certain view or design, in hopes their good fortune will at last guide them to what they search for" (i. 108). Like Kant, he resolves to reverse the process. Instead of regarding the conception as conforming to the object, he asks whether the object might not possibly be regarded as conforming to the conception. "Having found," he says, "that after the discovery of the constant conjunction of any objects, we always draw an *inference* from one object to another, we shall now examine the nature of that inference, and of the transition from the impression to the idea"; and "perhaps," he says, "it will appear in the end that the necessary connexion depends on the inference, instead of the inference's depending on the necessary connexion" (i. 123).

The argument by which Hume proceeds to establish this position so completely corresponds with that of Kant that it might well be mistaken for an extract from the *Kritik*. What is the authority for our inference that objects are necessarily connected, and that the future will be a reproduction of the past? According to Hume, "there can be no *demonstrative* arguments to prove that those instances of which we have had no experience resemble those of which we have had experience"; for "we can at least conceive a change in the course of nature, which sufficiently proves that such a change is not absolutely impossible" (i. 123). Neither, according to Hume, can the proposition be proved by any arguments from *probability*; for "probability is founded on the presumption of a resemblance betwixt those objects of which we have had experience, and those of which we have had none; and therefore it is impossible this presumption can arise from probability," inasmuch as "the same principle cannot be both the cause and effect of another"—an axiom which Hume regards as 'the only proposition concerning that relation which is either intuitively or demonstratively certain' (i. 124). But arguments from probability are only arguments from *experience*, and Hume treats the argument from experience thus:—"Should it be said that we have experience that the same power continues united to the same object, and that like objects are endowed with like powers, I would renew my question, why from this experience we form any conclusion be-

yond those past instances of which we have had experience? If you answer this question in the same manner as the preceding, your answer gives still occasion to a new question of the same kind, even in infinitum, which clearly proves that the foregoing reasoning had no just foundation" (i. 126). But not only does Hume propose the Kantian question and pursue the Kantian method, but he arrives at the Kantian conclusion. He doubts not but his sentiments will be treated by many as extravagant and ridiculous (i. 222), but his conclusion is that "the necessity of power, which unites causes and effects, lies in the *determination of the mind* to pass from the one to the other," just "as the necessity which makes two times two equal to four, or three angles of a triangle equal to two right ones, lies only in the act of the understanding by which we consider and compare these ideas" (i. 220).

So impressed was Hume with the novelty of his principle and the importance of his discovery that the object of his Inquiry was little more than to popularize the theory of the Treatise on this subject of causation. It was the main question with which he was concerned. "Hume," says Kant, "was wrong in inferring from the contingency of the determination according to law, the contingency of the law itself; and the passing beyond the conception of a thing to possible experience (which is an *a priori* proceeding, constituting the objective reality of the conception), he confounded with our synthesis of objects in actual experience, which is always, of

course, empirical" (p. 466). But, unfortunately for Kant, Hume takes the very distinction which Kant charges him with having overlooked. "These two propositions" "are far from being the same—I *have found* that such an object has always been attended with such an effect; and I *foresee* that other objects which are in appearance similar will be attended with similar effects" (iv. 42). "As to *past experience*," he says, "it can be allowed to give direct and certain information of those precise objects only, and that precise period of time which fell under its cognizance; but why this experience should be *extended to future times* and to other objects, which, for aught we know, may be only in appearance similar; this," he says, "is the main question on which I would insist" (iv. 42). This main question of Hume, it is evident was the question, which, according to Kant, constituted the grand problem of the Transcendental Philosophy—How are synthetic judgments *a priori* possible? (pp. 12, 44.) "All our experimental conclusions," he says, "proceed upon the supposition that the future will be conformable to the past: to endeavour, therefore, the proof of this last supposition by probable arguments, or arguments regarding existence, must be evidentially going in a circle, and taking that for granted which is the very point in question" (iv. 44). This may be regarded as the *formula* of Hume, "To say the inference is experimental," he says, "is begging the question, for all inferences from experience

suppose as their foundation that the future will resemble the past, and that similar powers will be conjoined with similar visible qualities" (iv. 46). "It is impossible," he repeats, "that any arguments from experience can prove this resemblance of the past to the future, since all these arguments are founded on the supposition of that resemblance" (*ibid.*). How then is the inference to be explained? It is not an *intuitive* principle, he says; for "it implies no contradiction that the course of nature may change" (iv. 43). Neither is it a *demonstrative* truth; for "there is required a medium which may enable the mind to draw such an inference." How then is it to be explained? No reading, no inquiry, he says, had been able to remove his difficulty, or give him satisfaction on a matter of such importance (iv. 47). His conclusion was a simple one, though, he confessed, pretty remote from the common theories of philosophy (iv. 56). It was that "as nature has taught us the use of our limbs without giving us the knowledge of the muscles and nerves by which they are actuated, so she has implanted in us an *instinct* which carries forward the thought in a corresponding course to that which she has established among external objects" (iv. 66); and that thus there is 'a kind of pre-established harmony between the course of nature and the succession of our ideas' (iv. 65)—the very conclusion at which, as we shall hereafter see, the great Transcendentalist himself arrived.

Hume's anticipation of Kant's theory of causation

might have been regarded as complete had it not been for his unfortunate dogma—that reason can supply us with no original idea, and that every idea is the copy of an impression. This compelled him, in considering the relation of cause and effect, whether as a philosophical or as a natural relation—whether as a comparison of two ideas, or as an association between them (i. 225)—to confine himself to the related ideas, and ignore the idea of relation. Hence it is that he defines a *cause* to be ‘an object precedent and contiguous to another, and so united with it that the idea of the one determines the mind to form the idea of the other, and the impression of the one to form a more lively idea of the other’ (*ibid.*). Hence it is that he regards ‘the impression which affords us the idea of *necessity*’ as being the ‘determination of the mind’ when, ‘upon the appearance of one of the objects, the mind is determined by custom to consider its usual attendant, and to consider it in a stronger light upon account of its relation to the first object’ (i. 207). But his dogma not only compels Hume to ignore the conception of causation, and to distort the conception of necessity which accompanies it, but it compels him to misrepresent the important operation of the mind by which the conception is attended. According to Hume, flame is constantly conjoined with heat, and snow is constantly conjoined with cold; and if, after experience of this constant conjunction, says Hume, ‘flame or snow be presented anew to the senses, the mind is carried by custom

to expect heat or cold,<sup>r</sup> and to believe that such a quality does exist, and will discover itself upon a nearer approach' (iv. 56). *Belief*, according to Hume, 'is more properly an act of the sensitive than of the cogitative part of our natures' (i. 240). Being thus referred to the sensitive portion of our nature, belief comes under the purview of the dogma. According to Hume, it does nothing but vary the manner in which we conceive an object, and can only bestow on our ideas additional vivacity and force; and accordingly 'belief,' he says, 'may be most accurately defined a lively idea related to or associated with a present impression' (i. 132).

It is evident that it would have been far wiser for Hume to have modified his dogma in order to explain these various ideas, rather than to have mutilated the ideas in order to retain the dogma. But even in the dogma there is an element of truth. As Hume truly remarks, 'it is impossible for us to *think* of anything which we have not antecedently *felt*, either by our external or internal senses' (iv. 73). This is the doctrine of the Kritik; but Kant goes further in his approach to Hume. Though he recognises the Categories as the great instrument of thinking, he admits that in themselves they are mere 'forms of thought' (p. 174)—'mere functions of the understanding' (p. 113)—mere rules for the anticipation of experience (p. 160)—mere abstractions which, without the aid of the process which he calls *schematism*, could never be represented as an image (p. 110)—mere conceptions of the under-

standing which, apart from intuitions of sense, are absolutely void (p. 46).

Whether Hume was consistent, in regarding *custom* as the chronological condition of the development of the idea of causation, may well be doubted. If, as he consistently holds, the idea of causation is presupposed in *all* our experimental conclusions, it must be presupposed in the *first* of such conclusions as much as in the last. It may be true, as Archer Butler remarks in his *Lectures on the History of Ancient Philosophy*, that though habit cannot originate the belief, it may confirm it, and that Hume's theory derives its plausibility from that fact (ii. 87). It may be true, as Bishop Butler remarks in his *Analogy*, that probable evidence is essentially distinguished from demonstrative by this, that it admits of degrees, and that though a man's having observed the ebb and flow of the tide to-day affords some sort of presumption that it may happen again to-morrow, yet it is only the long-continued experience of mankind which gives us full assurance that it will (pp. 1. 2). But in the consideration of Hume's philosophy this is a minor point. The main point is, that he refers the belief in the uniformity of nature not to experience but to instinct. "This instinct," he says, "it is true, arises from past observation and experience; but can anyone give the ultimate reason why past experience and observation produces such an effect, any more than why nature alone should produce it?" (i. 235).

It is evident from what precedes that, in his

position that all our experimental arguments are based on the anticipation of experience which is implied in the law of physical causation, and that therefore this law must be regarded as a determination of the mind itself, Hume not only recognized the existence of synthetic a priori judgments in all physical science, but showed how such synthetic a priori judgments were possible, by referring them to a determination of the mind. But there is another class of synthetic a priori judgments which Hume recognized, though he did not explain their possibility by applying to our intuitions of space and time the reasoning which he had applied to our conception of causation. He held that "the ideas of space and time are no separate or distinct ideas, but merely those of the manner or order in which objects exist" (i. 62); and that "as it is from the disposition of visible and tangible objects we receive the idea of space, so from the succession of ideas and impressions we form the idea of time" (i. 56). But Kant went utterly astray when he charged Locke and Hume with attempting to explain mathematical science by an 'empirical derivation' (p. 79). He did not observe that though Hume rejected Locke's theory of the origin of ideas, he accepted Locke's theory of knowledge; and he did not observe that Locke's theory of knowledge referred the first principles of mathematics to 'intuitive evidence' and 'reason,' just as his theory of ideas recognized the ideas of relation which were the creatures and inventions of the understanding.

As to Hume's opinion with reference to the a priori character of mathematics, there can be no intelligent diversity of opinion. "All the objects of human reason or inquiry," he says, "may naturally be divided into two kinds—to wit, *Relations of Ideas* and *Matters of Fact*. Of the first kind are the sciences of geometry, algebra, and arithmetic; and, in short, every affirmation which is either intuitively or demonstratively certain. That the square of the hypotenuse is equal to the square of the two sides is a proposition which expresses a relation between these figures. That three times five is equal to the half of thirty expresses a relation between these numbers. Propositions of this kind," he says, "are discoverable by the mere operation of thought without dependence on what is anywhere existent in the universe" (iv. 32). In his earlier work, Hume, it is true, had made a distinction between geometry on the one hand, and algebra and arithmetic upon the other. Holding all the primary mathematical relations to be 'discoverable at first sight,' and to fall 'under the province of intuition' (i. 99), he nevertheless had held that geometry never attained perfect precision and exactness, and therefore could scarcely be regarded as a perfect science (i. 100). The objects of geometry, he had said, not only never did, but never could, exist in nature; no one could pretend to draw a line, or make a surface conformable to the definition (i. 66). The standard of equality in geometry was, therefore, loose (i. 73), and the mind only proceeds to imagine a standard

more correct, as a galley, put in motion by its oars, is carried on its course without a new impulsion (i. 258). But Hume, upon reconsideration, did not care to reaffirm the tenet of his youth. He abandoned the doctrine of the Treatise, and left it derelict, to be appropriated as a discovery in the logic of the sciences by his successors. In his Inquiry he holds with Locke and with Kant that, "though there never were a circle or triangle in nature, the truths demonstrated by Euclid would ever retain their certainty and evidence" (iv. 32), and maintains that all mathematical propositions alike are independent of experience, and that they are alike discoverable by the mere operation of thought.

Nor was Hume ignorant of the different characteristics which distinguish our synthetical a priori judgments in mathematics from our synthetical a priori judgments in experimental science. "All other inquiries of men," he says, "regard only *Matter of Fact and Existence*; and these are evidently incapable of demonstration," since 'the existence of any being can only be proved by arguments from its cause or its effect' (iv. 34). Nor are the physical sciences an exception to this general assertion; for though 'every part of mixed mathematics proceeds upon the supposition that certain laws are established by nature in her operations' still 'the discovery of the law itself is owing merely to experience' (iv. 39). 'The contrary of every matter of fact is still possible, because it can never imply a contradiction, and is conceived by the mind with the same

facility and distinctness as if ever so conformable to reality,' and therefore the evidence of its truth, however great, is not of a like nature with the evidence of mathematics (iv. 33). And Hume proceeds to develop the difference between them. 'The component parts of quantity and number,' he says, 'are entirely *similar*,' whereas 'all other ideas are clearly distinct and *different* from each other' (iv. 190)—for 'in this kind of reasoning from causation we employ materials which are of a mixed or *heterogeneous* nature' (i. 117). Although *necessity* is always ascribed to causes and effects, yet 'we have no notice of any necessity of connexion' beyond 'the constant conjunction of similar objects and the consequent inference from one to the other' in the course of our experience (iv. 97; i. 206); for 'it is only *experience* which teaches us the nature and bounds of cause and effect, and enables us to infer the existence of one object from that of another' (iv. 191). But 'while we cannot give a satisfactory reason why we believe after a thousand experiments, that a stone will fall, or fire burn; can we ever satisfy ourselves concerning any determination which we may form with regard to the origin of worlds, and the situation of nature from and to eternity?' (iv. 190). 'It seems to me,' then, says Hume, 'that the only objects of the abstract sciences, or of demonstration, are quality and number, and that all attempts to extend this more perfect species of knowledge beyond their bounds are mere sophistry and illusion' (iv. 191).

It must be clear to the student of the Kantian philosophy that Hume's Relations of Ideas and Matter of Fact correspond to the *Mathematical and Dynamical Principles* of the Understanding, as Kant explains them in the Kritik—the one relating to intuition alone, the other to the existence of phenomena (p. 121)—the one effecting a synthesis of the homogeneous, the other a synthesis of things which, although heterogeneous, are represented a priori as connected by the principles of causality and substance (p. 122); the one constitutive of the phenomena so as to determine their existence, the other regulative of the understanding, so as to render possible their apprehension (p. 135); the one characterized by an absolute necessity, the other only conditionally (p. 121), and hypothetically (p. 170) necessary; the one, in fine, supplying a basis for mathematics as an apodeictic science, the other supplying a basis for natural science within the limits of experience, but supplying no basis for a science of metaphysics, considered as a science of supersensible existence (p. 328).

And in showing that metaphysics, as contrasted with the physical sciences and mathematics, are mere sophistry and illusion, Hume again anticipates the method and the arguments of Kant. If Kant in his *Rational Psychology* declares that the mind has no intuition of itself, and that we can never ascertain by reasoning whether there exists any object to correspond to our conception of the soul as a substance, simple, identical, and distinct

from body (pp. 239, 244)—Hume maintains that others ‘may perceive something simple and continued which he calls *himself*’: but he is certain that there is no such principle in *him* (i. 321); and the fact that we have no satisfactory notice of substance, whether mental or material, seems to him a sufficient reason for abandoning utterly that dispute concerning the materiality and immateriality of the soul and makes him absolutely condemn the very question (i. 299). In his *Transcendental Theology* Kant proclaims that the fallacy of every attempt of the speculative reason to establish the existence of a God by way of demonstration is shown by this—that “in whatever way the understanding may have attained to a conception, the existence of the object of the conception cannot be discovered in it by analysis, because the cognition of the existence of the object depends upon the object’s being posited and given in itself apart from the conception” (p. 392). These are the very words of Hume. “In the proposition *God is*, or indeed any other which regards existence, the idea of existence is no distinct idea which we unite with that of the object, and which is capable of forming a compound idea by the union” (i. 132). The inference of an Intelligent Cause is uncertain ‘because the subject lies entirely beyond the reach of human experience’ (iv. 166); and ‘it is only experience which teaches us the nature and bounds of cause and effect, and enables us to infer the existence of one object from that of another’ (iv. 191).

But nowhere, according to Hume, is the sophistry and illusion of the so-called metaphysical sciences more patent than in the attempts that have been made to establish a system of *Rational Cosmology*, and to demonstrate the existence of an external world of matter. It was with regard to the Senses that his scepticism was most pronounced. The trite topics which Cicero, as the representative of the Academic school, had adduced, when arguing with Lucullus, Hume did not insist on. He proposed an argument more profound than that based upon the crooked appearance of the oar in water, or the shifting colours on the bosom of the dove (iv. 176). He acknowledged it to be evident that "men are carried by a natural instinct, or prepossession, to repose faith in their senses; and that, without any reasoning, or even almost before the use of reason, we always suppose an external universe which depends not on our perception, but would exist though we and every sensible creature were absent or annihilated" (iv. 177). But, he said, "it seems also evident, that when men follow this blind and powerful instinct of nature, they always suppose the very images presented by their senses to be the external objects, and never entertain any suspicion that the one are nothing but representations of the other" (iv. 177). "But this universal and primary opinion of all men," he says, "is soon destroyed by the slightest philosophy, which teaches us that nothing can ever be present to the mind but an image or perception, and that the senses are only the in-

lets through which these images are conveyed, without being able to produce any immediate intercourse between the mind and the object" (iv. 177). "So far, then," he continues, "are we necessitated by reasoning to contradict, or depart from, the primary instincts of nature, and to embrace a new system with regard to the evidence of our senses" (iv. 178). "But here philosophy finds herself extremely embarrassed when she would justify this new system, and obviate the cavils and objections of the sceptics" (iv. 178). It is evident that 'it is a question of fact whether the perceptions of the senses be produced by external objects resembling them'; and this question of fact, like all other questions of fact, must be determined by *experience*. "But here," says Hume, "experience is and must be silent, for the mind has never anything present to it but the perceptions, and cannot possibly reach any experience of their connexion with objects" (iv. 179). Is the question then to be determined by *reason*? 'To justify the pretended philosophical system by a chain of clear and consistent argument exceeds the power of all human capacity' (iv. 178); "for by what argument," he asks, "can it be proved that the perceptions of the mind must be caused by external objects, entirely different from them, though resembling them, if that be possible, and could not arise either from the energy of the mind itself, or from the suggestion of some invisible or unknown spirit, or from some other cause still more unknown to us?" (iv. 178; i. 117). This, then, is the philo-

sophical position. "Do you follow the instincts and propensities of nature in assenting to the veracity of sense? But these lead you to believe that the very perception or sensible image is the external object. Do you disclaim this principle in order to embrace a more rational opinion that the perceptions are only representatives of something external? You here depart from your natural propensities and more obvious sentiments, and yet are not able to satisfy your reason, which can never find any convincing argument from experience to prove that the perceptions are connected with any external objects" (iv. 179). This is Hume's *dilemma*. The opinion of external existence, he says, "if rested on natural instinct, is contrary to reason, and, if referred to reason, is contrary to natural instinct, and at the same time carries no rational evidence with it, to convince an impartial inquirer" (iv. 181).

In thus pointing out the sophistical and illusive character of the ordinary arguments by which metaphysicians propose to demonstrate the existence of the external world, Hume anticipated the philosophy of Reid. But he went further, and again anticipated the more profound philosophy of Kant. When men follow the blind and powerful instinct of nature, they always suppose the very images presented by the senses to be the external objects (iv. 177). This is the *Transcendental Realism* of the Kritik; for 'the realist in the transcendental sense regards the modifications of our sensibility, its mere representations,

as things subsisting by themselves' (p. 307). But this *Transcendental Illusion*, as Kant calls it, involves the human reason in a conflict with itself. Had the world a beginning, or had it not? Is matter infinitely divisible or not? Is a free causality necessary to originate the phenomena of the world or no? Is there, or is there not, a necessary being required to account for the existence of the world? On each of these questions the thesis and antithesis are alike sustainable by reason, and this conflict of reason with itself was the *Transcendental Antithetic*. Kant settles the dispute by proclaiming that the combatants are fighting about nothing, and that it is no transcendental reality that is presented to us, but *phenomena* only (p. 315). Again, this is the philosophy of Hume. He, too, contemplated this conflict of reason, and perceived the true solution (i. 78). "As long as we confine our speculations to the *appearances* of objects to our senses," he says in the *Treatise*, "without entering into disquisitions concerning their real nature and operations, we are safe from all difficulties, and can never be embarrassed by any question" (i. 92, 93). "It seems to me not impossible to avoid these absurdities and contradictions," he says in the *Inquiry*, "if it be admitted that there is no such thing as abstract, or general ideas, properly speaking," and "that all the ideas of quantity, upon which mathematicians reason, are nothing but particular, and such as are suggested by the senses and imagination, and consequently cannot be infinitely divisible" (iv. 184). "It is

sufficient to have dropped this hint," he says, "without prosecuting it any further" (*ibid.*). The further prosecution was reserved for Kant; and the hint dropped by Hume was elevated by his successor into the Critical Solution of the Cosmologic Problem (p. 310).

But while Hume, like Kant, pronounces metaphysics to be mere sophistry and illusion, he at the same time, like Kant, pronounces it to be mere sophistry and illusion when considered in the light of *demonstration*. "We may well ask," he says, "what causes induce us to believe in the existence of body? But it is vain to ask, whether there be body or not—that is a point which we must take for granted in all our reasonings" (i. 245). Though no 'logic' or 'process of argument' can secure us from the supposition that the course of nature may change, yet as 'agents' we are 'quite satisfied in the point' (iv. 47). And in the same manner, though Hume contends that we cannot demonstrate the existence of a Deity in mathematical form, yet he admits that 'the whole frame of nature bespeaks an Intelligent Author,' and that 'no rational inquirer can, after serious reflection, suspend his *belief* a moment with regard to the primary principles of genuine theism and religion' (iv. 435). In fact, the whole scope of his argument is shown in the sentences with which he concludes his discussion as to the materiality or immateriality of the soul—sentences so thoroughly imbued with the spirit of Kant that they read like an extract from the

Kritik:—“In both cases the *metaphysical* arguments for the immortality of the soul are equally inconclusive; and in both cases the *moral* arguments, and those derived from the analogy of nature, are equally convincing. If my philosophy, therefore, makes no addition to the arguments for religion, I have, at least, the satisfaction to think it takes nothing from them, but that everything remains precisely as before” (i. 319).

This contrast between the speculative demands and the practical necessities of human nature is constantly insisted on by Kant. Indeed, he professes to have abolished knowledge in the domain of metaphysics for no other purpose than to make way for belief (p. xxxv). “If anyone could free himself entirely from all considerations of interest,” he says, “and weigh without partiality the assertions of *reason*, attending only to their content, irrespective of the consequences which follow from them, such a person, on the supposition that he knew no other way out of the confusion than to settle the truth of one or other of the conflicting doctrines, would live in a state of continued hesitation.” “But,” continues Kant, “if he were called to *action*, the play of the mere speculative reason would disappear like the shapes of a dream, and practical interest would dictate his choice of principles” (p. 298). This passage, again, might pass for a paraphrase of a dozen passages to be found in Hume. “Though a Pyrrhonian,” he says, “may throw himself or others into a momentary

amazement and confusion by his profound reasonings, the first and most trivial event in life will put to flight all his doubts and scruples"; and, "when he wakes from his dream, he will be the first to join in the laugh against himself, and to confess that all his objections are mere amusement, and can have no other tendency than to show the whimsical condition of mankind, who must act, and reason, and believe, though they are not able by the most diligent inquiry to satisfy themselves concerning the foundation of these operations, or to remove the objections which may be raised against them" (iv. 187). "These principles," he says, "may flourish and triumph in the schools, where it is indeed difficult, if not impossible, to refute them. But as soon as they leave the schools, and by the presence of the real objects which actuate our passions and sentiments, are put in opposition to the more powerful principles of our nature, they vanish like smoke, and leave the most determined sceptic in the same condition as other mortals" (iv. 185).

Such being the condition of human nature, the advice which Hume gives to the philosopher has been strangely overlooked. 'Be a philosopher,' he says, 'but, amidst all your philosophy, be still a man' (iv. 7). And it is the manly character of Hume's philosophy that constitutes one of its best titles to our respect. In point of fact, he was neither a Dogmatist nor a Sceptic—he was the Sapiens of the Academics. Like Carneades, he abolished perception to make way for assent. Like

Kant, he abolished knowledge to make way for belief. He saw, in fact, that the dispute between the Dogmatist and Sceptic was little better than a dispute about words—a dispute as to whether it was the convex or the concave side of the circumference that formed the circle—a dispute as to whether the suspended shield of the errant knights was made of silver or was made of gold. In his posthumous Dialogues concerning Natural Religion, which he modelled on the form of Cicero's Discourses concerning the Nature of the Gods, and which, in elevation of tone, in eloquence of language, and in comprehensiveness of thought, is worthy of its original, Hume thus describes the nature of the controversy which distracts the rival schools, and effects a compromise between them:—"It seems evident," he says, "that the dispute between the Sceptics and Dogmatists is entirely verbal, or at least regards only the degrees of doubt and assurance which we ought to indulge with regard to all reasoning; and such disputes are commonly at the bottom verbal, and admit not of any precise determination. No philosophical Dogmatist denies that there are difficulties both with regard to the senses and to all science, and that these difficulties are, in a regular logical method, absolutely insoluble. No Sceptic denies that we lie under an absolute necessity, notwithstanding these difficulties, of thinking and believing and reasoning with regard to all kinds of subjects, and even of frequently assenting with confidence and security. The only

difference, then, between these sects, if they merit that name, is, that the Sceptic, from habit, caprice, or inclination, insists most on the difficulties, the Dogmatist, for like reasons, on the necessity" (ii. 537).

The criticism which Kant passed upon the philosopher who awoke him from his dogmatic slumber is well known. Hume, he says, stopped short at the synthetical proposition of the connexion of an effect with its cause, and insisted that such a proposition a priori was impossible (p. 12). He adopted the empirical derivation of Locke, and therefore could not explain how it was possible that conceptions which are not connected with one another in the understanding must nevertheless be thought as necessarily connected in the object (p. 78). He never clearly developed the notion that we proceed in judgments of a certain class beyond our conception of the object (p. 464). He confounded the passing beyond the conception of a thing to possible experience with our synthesis of objects in actual experience, which is, of course, empiric (p. 466). He made no distinction between the well-grounded claims of the understanding and the dialectical pretensions of the reason (*ibid.*). He merely declared the understanding to be limited, instead of showing what its limits were; and he created a general mistrust in the power of our faculties, without giving us any determinate knowledge of the bounds of our necessary and unavoidable ignorance (*ibid.*).

The injustice of this criticism is obvious from what precedes. In proposing the question, why experience should be extended to future times and other objects, Hume suggested the *Transcendental Problem* of the Reason. In arguing that the conception of causation could not be derived from experience because all our experimental conclusions are based on the conception of causation, Hume employed the *Transcendental Method*. In holding that nothing can be present to the mind but an image or perception, and in denying that the images presented to the senses are external objects, or things subsisting by themselves, he enounced the conclusion which the *Transcendental Æsthetic* professed to have established (*Kritik*, 307). In holding that the existence of any being can only be proved by arguments from its cause or its effect, and that it is only experience which teaches us the nature and bounds of cause and effect, and enables us to infer the existence of one object from that of another, he, in effect, held that the understanding is competent to effect nothing a priori except the anticipation of the form of a possible expression, and reached the result at which the *Transcendental Analytic* afterwards arrived (*Kritik*, 183). And finally, his position, 'that the only objects of the abstract sciences or of demonstration, are quantity and number, and that all attempts to extend this more perfect species of knowledge beyond these bounds are mere sophistry and illusion,' is the very conclusion of the *Transcendental Dialectic*—the con-

clusion to the ultimate establishment of which the whole of the *Kritik* was directed (*Kritik*, 429).

If it should be asked how these resemblances between the conclusions of the two greatest of the philosophers of modern Europe have been overlooked, the answer is obvious. It is the result of the confusion of tongues in which the Babel of Philosophy is involved. The one of the great thinkers spoke English, and the other Greek. Hume saw as clearly as Kant that men will never be induced to abandon the airy sciences from disappointment; that the only method of freeing learning from those abstruse inquiries was to make an exact analysis of the powers and capacities of the human understanding; and that we must submit to this fatigue in order to live at ease for ever after (iv. 10); but, unfortunately, he did not style his analysis a *Propædæutic* or a *Kritik*. He saw that the mind in all its experimental conclusions anticipates its experience without seeing this was a *Synthetic a priori Judgment*; and when he saw that such judgments could not be formed without a determination of the mind, he failed to see that this was the solution of the grand *Transcendental Problem* of Pure Reason. He said that the law of causation could not be founded on arguments from experience, because all arguments from experience are founded on the law of causation (iv. 46, 7); but he had no suspicion that this should be called the *Transcendental Method*. He said the mind was a centre of perceptions; but he did not baptize it the *Transcendental*

*Unity of Consciousness.* He held that objects are nothing but a collection of simple ideas that are united by the imagination into one (i. 33); but he did not confer upon the collection the title of the *Transcendental Synthesis of the Imagination*. He saw that the philosophical relations which the understanding framed might be classified under seven different heads; but he did not dub them *Categories of the Understanding*. He divided philosophical relations into two classes (i. 98), and the objects of human inquiry into two kinds (iv. 32); but he never dreamt that his relations of ideas and matters of existence were to be elevated to the rank of the *Mathematical and Dynamical Synthesis of Thought*. He saw that when men follow the instincts of their nature they suppose the images presented by the senses to be the external objects (iv. 177); but he did not dream that this was *Transcendental Realism*. He dropped the hint that all our ideas of quantity are nothing but particular, and such as are suggested by the senses (iv. 184); but he had no notion that this hint would ever be developed into the *Critical Solution of the Cosmologic Problem*. He saw that the mind was involved in absurdities and contradictions in its ideas of the world, and that its conclusions as to the nature and essence of the soul were inconclusive; but words of such pretence as the *Antinomies of Cosmology*, or the *Paralogisms of Psychology*, were foreign to his simple tastes. He saw, in fine, that the mind, in straining after the infinite and absolute, was constrained to form the last and most ennobling of ideas;

but he never thought of *Prototypon Transcendentale* as a name for God.

The fact is that Hume employed the simple language of ordinary men, while Kant invented an artificial language for the schools. And the effect of this diversity has been decisive. The two philosophers have spoken a different language, and they have been regarded as holding hostile views. Hence, too, the reputation of the transcendentalist has been exalted, while that of the sceptic has been depressed. In the system of the one there was nothing to impede the progress, and the treacherous facility betrayed the reader into the belief that he was learning nothing; in the system of the other there was a language to be mastered, and the difficulty of mastering it inspired the student with a respect for the thinker who imposed upon him such laborious toil. Nor did the effect terminate in this. The Kantian student is apt to mistake the mastery of a language for the acquisition of a science. Conscious of the possession of a recondite learning, he is inspired with the conceit of a superior knowledge. The vulgar, too, are apt to look with mysterious awe upon what they cannot understand, because they cannot understand it; and hence the different estimation in which the two great philosophers of modern Europe have been held. In the one, the stream of speculation has appeared to be shallow because it was so clear; in the other, it has been regarded as a dark profound, and has been deemed to be the deeper because it was so dark.

The moral deduced from the paralysis of the speculative reason by the transcendentalist and the sceptic was the same. Each, while he surrendered the power of cognising, reserved the power of cogitating, the supersensible. Each, while he abolished knowledge, made room for belief. Each left the space which had been left vacant by speculation to be filled by the principles of action. According to both, the weakness of our intelligence should induce us to moderate the strength of our assertions. According to both, the fallaciousness of sense, and the incompetence of reason, should teach us modesty and mutual toleration and reserve. According to both, the result of the most profound philosophy was the limitation of our inquiries to such subjects as are best adapted to the narrow capacity of human understanding. The lesson taught by both, in fine, was that which was taught centuries before by Socrates, and which generations before Socrates had been inculcated by that first and saddest of books, the inspired idyll, in which the Idumean patriarch bewailed the weakness and the ignorance of man.

What then is the attitude assumed by Hume with regard to the great mystery of sense, the problem of the world? By anticipation he rejects the Natural Realism, or, as it might be better named, the *Cataleptic Idealism* of Hamilton; for he denies that there can be any immediate intercourse between the mind and the object (iv. 177), and maintains that in perception 'the mind has never anything present to it but the perceptions, and can-

not possibly reach any experience of their connexion with objects' (iv. 179). In like manner he repudiates the *Cosmothetical Idealism* of Reid; for he agrees with Berkeley that the primary qualities of the objects of sense stand on the same footing as the secondary, and that the secondary qualities are 'perceptions of the mind without any external archetype or model which they represent' (iv. 180). In holding that the mind is nothing but a collection of different perceptions which succeed each other with an inconceivable rapidity, and are in a perpetual flux and movement (i. 321)—above all, in holding that 'the idea of existence is the very same with the idea of what we conceive to be existent' (i. 96)—he seems to accept the *Psychological Idealism* of Mill. But though in his psychology he refuses to recognize either the conceptions or the principles of efficient causation and essential substance, yet in his metaphysics he finds himself compelled to admit that our impressions have a cause, and thus to recognize with Kant the existence of a non-sensuous cause of our sensations. This cause, however, he regards as essentially unknown, and accordingly he refuses to identify it with God, and rejects the *Theistic Idealism* of Berkeley. For the same reason he refuses to identify it with the soul, and rejects the *Egoistical Idealism* of Fichte. "As to those impressions which arise from the senses," he says in the Treatise, "their ultimate cause is, in my opinion, perfectly inexplicable by human reason, and it will always be impossible to decide with cer-

tainty whether they arise immediately from the object, or are produced by the creative power of the mind, or are derived from the Author of our being" (i. 117). "By what argument can it be proved," he asks in the Inquiry, "that the perceptions of the mind must be caused by external objects, entirely different from them, though resembling them (if that be possible), and could not arise from the energy of the mind itself, or from the suggestion of some invisible and unknown spirit, or from some other cause still more unknown to us?" (iv. 178). In short, Hume agrees with Kant when he says that the non-sensuous cause of our sensations is "an object of which we are quite unable to say whether it can be met with in ourselves or out of us, whether it would be annihilated together with sensibility, or, if this were taken away, would continue to exist" (p. 206). But although Hume thus agrees with Kant, he formed no conception of the *Transcendental Idealism* of the Kritik. He held that 'the ideas of space and time are no separate and distinct ideas, but merely those of the manner or order in which objects exist' (i. 62); and he seems never to have thought of applying the formula by which he had determined the nature of our conception of causation to the determination of the nature of our ideas of time and space. Indeed, so far is Hume from dogmatically denying the existence of an external world in external space that he systematically assumes it (i. 245). He admits that the arguments against the existence of material things produce

no conviction, though they admit of no answer (iv. 181). His idealism was merely a *Problematical Idealism*. He proposed to philosophy a problem, and he confronted it with a dilemma. His problem was, the ground of the opinion of external existence; and his dilemma was, that "the opinion of external existence, if rested on natural instinct, is contrary to reason, and if referred to reason, is contrary to natural instinct, and at the same time carries no rational evidence with it to convince an impartial inquirer" (iv. 181).

This then was the position of the problem as to the external world when Hume transmitted it to Reid. Hume had professed to show the whimsical condition of mankind, who must act, and reason, and believe, though they are not able, by their most diligent inquiry, to satisfy themselves concerning the foundation of these operations, or to remove the objections which may be brought against them" (iv. 187). Let us see how Reid satisfied himself concerning the foundation of the operations in question, and how he proposed to remove the various objections which had been advanced by Hume.

COSMOTHEtical IDEALISM:

OR

REID.

# COSMOTHEtical IDEALISM:

OR

REID.

*Rerum ignarus Imagine gaudet.*—VIRG.

THE influence exerted by Reid on the development of European thought has been neither slight nor transitory. Though Hutcheson is regarded as the founder of the Scottish school, it was Reid who gave it character, and consistency, and strength. Stewart avowedly regarded him as his master; and if Brown disputed his authority, the influence of Reid's speculations is everywhere visible in the writings of that brilliant thinker. Attracted by the masculine simplicity and sober common sense of the Scottish sage, men of a far higher order of metaphysical ability, have devoted themselves to the diffusion and elucidation of his writings. The philosophy of the chief of the Scottish school was taught by Royer-Collard, and his complete works

were translated for the benefit of continental readers by Jouffroy. The most learned of the philosophers of modern times devoted himself to the development of his doctrine; and Sir William Hamilton's edition of the works of Reid, defective as it may be in point of consistency and form, contains the richest deposit of materials for metaphysical speculation that the literature of philosophy can furnish.

The position of Reid as a philosopher was a peculiar one. He had himself been an idealist (*Works*, p. 88). He had not only been an idealist, but he had been a Berkeleian (p. 283). He had been a Berkeleian though he believed that Berkeley, while rejecting the world of material things, had accepted a world of material ideas (p. 263). Nay, he had been a Berkeleian although he professed himself unable to understand Berkeley's theory of notions, and regarded all his ideas as resolvable into ideas of sensation (p. 289). But the idealism of Hume aroused him from his ideal dreams. He was shocked at the discovery that the mind in which he had supposed the world of ideas to exist was destitute of substance. He found that in descending the winding pathway of ideas he had been conducted, unaware, to the abyss—

Hic specus horrendum, saevi spiracula Ditis  
Monstrantur; ruptoque ingens Acheronte vorago  
Pestiferas aperit fauces.

Descartes and Locke, he said, had taken the same road, but they did not see the end. Berkeley saw the danger, and endeavoured to avoid it. But the

author of the *Treatise of Human Nature* was more daring—he turned neither to the right hand nor to the left, and like Virgil's Alecto shot boldly and directly into the yawning gulf (pp. 207–8).

When Reid thus fancied that Acheron had burst its borders, in the first paroxysm of terror, he seems to have reproached philosophy with the pernicious and malignant ray which it supplied, and to have declared his determination to renounce its guidance, and to allow his soul to dwell with common sense (p. 101). He railed at philosophy like the old fellow in one of Goldsmith's plays. This same philosophy, said Jarvis, is a good horse in the stable, but an arrant jade upon a journey. Philosophy, said Reid, is a hobby-horse, which a sick man might mount in his closet but could not ride to the exchange (p. 110). Scepticism was the lunacy of metaphysics (p. 209). If the sceptic were sincere, he should run his head against the post, he should step into the kennel, he should walk over the precipice, and the only way to save him would be to clap him into a lunatic asylum (p. 184). Sometimes, indeed, Reid takes a loftier tone. The philosophers, he said, had carried on an unequal contest with common sense. They had engaged in an attempt no less audacious and abortive than the attempt of the giants to dethrone great Jove (p. 101). The principles of common sense were the inspiration of the Almighty, and those who disowned their authority proclaimed God himself to be a mere deceiver (pp. 130, 329).

So far Reid would seem to be the mere demagogue of philosophy, appealing to the populace against the aristocracy of thought, and Hume might have addressed him as Cicero addressed Lucullus:—*quid me in invidiam, et tanquam in concionem, vocas, et quidem, ut seditiosi tribuni solent, occludi tabernas jubes?* (*Acad.* ii. 47). But Reid, in his own opinion, was no seditious tribune of the people. He considered himself the Cincinnatus, not the Clodius, of philosophy. He was the sober dictator, summoned, as it were, from the plough, to repel the inroads of the sceptics, and to regulate and harmonize the state. He was the inventor of a new method. He regarded himself as the new Bacon. His principles were a *novum organum* for the science of the mind; and, like the Baconian induction, his method was the birth of time.

“The merit of what you are pleased to call my philosophy,” he says to one of his correspondents, “lies, I think, chiefly in having called in question the common theory of ideas or images of things in the mind, being the only objects of thought; a theory founded on natural prejudices, and so universally received as to be interwoven with the structure of the language” (p. 88). He himself, he said, had long held this theory, and regarded it a self-evident and unquestionable truth. It was the unsuspected consequences to which it led that occasioned his misgivings. ‘The discovery,’ he said, ‘was the birth of time, and Berkeley and Hume did more to bring it to light than the man that hit on

it' (*ibid.*). In the chapter of his *Essays* in which he gives an historical sketch of the sentiments of philosophers about the perception of external objects, he tells us what this capital discovery was. "All philosophers, from Plato to Mr. Hume," he says, "agree in this—that we do not perceive external objects immediately, and that the immediate object of perception must be some image present to the mind" (p. 263). It was in the detection of this prejudice that Reid himself rested his reputation as a thinker, and it was on its refutation that his fame is rested by the most eminent of his disciples.

That we do not perceive external objects immediately is, undoubtedly, the accredited doctrine of philosophy. The predominant opinion cannot be better expressed than in the language of the Cyrenaic philosophers:—*Negant esse quidquam quod percipi possit extrinsecus; ea se sola percipere quae tactu intimo sentiant, ut dolorem, ut voluptatem; neque se, quo quid colore, aut quo sono, sit scire, sed tantum sentire, adfeci se quodam modo* (*Acad.* ii. 24). The great majority of philosophers have agreed with Descartes that all our knowledge, whatever its extent, is essentially subjective. They have agreed with Locke, that though the mind of man may take its flight beyond the stars, and make incursions into the incomprehensible inane, it never goes beyond its own ideas (II. vii. 10). They have agreed with Berkeley, that all the choir of heaven and all the furniture of earth, so far as they are objects of con-

consciousness, or immediate intuition, have no existence but in mind (*Prin.* vi). They have agreed with Hume, that if we chase our imagination to the heavens, or to the utmost limits of the universe, we never really advance a step beyond ourselves (i. 97). They have agreed with Condillac, that whether we ascend to the heavens, or descend to the abyss, we never issue from ourselves, or perceive anything beyond our own perceptions. They hold with Kant that in whatever way our knowledge may relate to objects, the only manner in which it immediately relates to them is by means of intuitions (p. 21). They hold with Cousin that neither the outward world, nor God, nor the soul itself, as substance, are objects of consciousness, and that the only objects of consciousness are the operations of the mind—its ideas, conceptions, and beliefs (*Psych.* p. 101).

But this was not the doctrine of the philosophers which Reid selected for attack. He conceived that all the philosophers before him held our sensible ideas to be 'self-existent and independent' entities (p. 109). He conceived them to hold that the ideas furnished through the senses are 'objects that are present in the mind or in the brain,' on which 'the operations of the mind, like the tools of an artificer,' are employed (p. 277). The ideas of the existence of which he required a proof were 'not the operations of the mind, but the supposed objects of those operations' (p. 298). They were ideas distinguished at once from the external object and from the per-

cipient sense. In the words of his editor, commentator, and disciple, he always ‘understands by idea, image, phantasm, species, etc., a *tertium quid*, numerically different both from the object existing and from the subject knowing’ (*Psych.* p. 106)—he ‘understands always certain representative entities distinct from the knowing mind’ (p. 326). These ideas, says Reid, were first introduced into philosophy in the humble character of representatives of things; but by degrees they supplanted their constituents (p. 109). They had led to the negation of material things by Berkeley, and to the negation of all substantial reality by Hume (*ibid.*). These ‘self-existent and independent ideas,’ he said, were thus ‘left alone in the universe’ (*ibid.*)—‘free and independent as the birds of the air,’ or as the atoms of Epicurus ‘when they pursued their journey in the vast inane’ (p. 109). According to Reid, the shadows of the subterranean cave of Plato, and the pictures in the darkened room of Locke might be applied to all the systems of perception that had been invented (p. 263). All philosophers, from Plato to Hume, he said, were agreed that these representative entities were the sole object of perception (*ibid.*).

Whether the philosophers, in reality, held this imputed doctrine, has been made the subject of a most acrimonious dispute. The dispute was commenced by Priestley, and was taken up by Brown. Brown contends that, with the exception of Malebranche and Berkeley, who, he says, entertained

peculiar notions on the subject, the philosophers whom Reid considered himself as opposing would all, if they had been questioned by him, have admitted, before they heard a single argument on his part, that their opinions with respect to ideas were precisely the same as his (*Lect.* xxvii). Hamilton, on the other hand, maintains that "the attempt to show that Reid in his refutation of the previous theory of perception was only fighting with a shadow—was only combating philosophers who, on the point in question, really coincided with himself—would, if successful, prove not merely that the philosophical reputation of Reid is based upon a blunder, but would, in fact, leave us no rational conclusion, short not of idealism only, but of absolute scepticism" (*Lect.* ii. 44). But this controversy must be decided in favour of the views of Brown. It is true that the followers of Democritus held, in the language of their laureate, that our sensible ideas are the effigies and spectral forms of things—*simulacra* stripped from the surface of the object—films flitting in every direction through the air. But seventeen centuries before Reid this theory of entity images had been overwhelmed with ridicule. What are these images of yours, said Cicero to Velleius, and whence are they derived? How is it that one image comes into my mind, and another into yours? How do you explain the image of a scylla, a chimæra, or a hippo-centaur? How do you stamp the image not only on the eye but on the mind? Such, in effect, was Cicero's polemic against

the Epicurean doctrine in the *Tusculan Questions*, and the *Discourses on the Nature of the Gods*. As to the great mass of ancient and modern philosophers, it would be a vain affectation to turn against Hamilton the learning derived from Hamilton himself. For Hamilton sings a palinode in his edition of the works of Reid. In that admirable production he shows that the doctrine of membranes, and images, and films, received no countenance from Plato (p. 262). He shows that the doctrine of intentional species can only be attributed to Aristotle on the ground of vague and metaphorical expressions, and is inconsistent with the whole spirit of his philosophy (p. 827). He shows that the Schoolmen distinguished the physical impression from the mental act (p. 267). He shows that Descartes and Leibnitz identified idea with perception, and only admitted a logical difference between them (p. 877). He expressly says, "that from the period of Descartes we may confidently affirm that the hypothesis of a representative perception, where the immediate object was something different from the mind, had been almost universally superseded by the representative hypothesis, in which the vicarious object was held only for a modification of the mind itself" (p. 957). The case, he says, is different with Malebranche and Berkeley (p. 207). But even Malebranche held, as already has been shown, that ideas were modifications, not of the mental essence, but the mental action; and it is the cardinal point of Berkeley's system that ideas are mere affections of

the mind. Hamilton, it is true, stigmatizes the generality of the English psychologists as mechanical, and maintains that the theory of entity ideas was held by Hobbes, and Locke, and Hume; by Newton, and by Norris, and by Clarke, to say nothing of Willis, and Porterfield, and Hook (*Disc.* 80, 85). But the great English psychologists are precisely those whom Hamilton would seem never to have studied. Hobbes ridicules the visible and audible species of the philosophy schools (*Works*, iii. 3), and defines a phantasm to be the act of sense (i. 392). Locke speaks with scorn of the intentional species of the Schoolmen (iii. x. 14), and declares that our ideas are nothing but actual perceptions in the mind (ii. x. 2). Hume takes the trouble to explain that by the term impression he would not be understood to express the manner in which our lively perceptions are produced in the soul, but merely the perceptions themselves (i. 16). Cudworth, in his *Immutable Morality*, tells us that sensations, formally considered, are certain passions or affections of the soul, fatally connected with some local motions in the body (p. 82). Clarke, in his *Discourse on the Being and Attributes of God*, declares that our sensible ideas are plainly thoughts or modifications of the mind itself, which is an intelligent being, and are not properly caused, but only occasioned by the impressions of figure and motion (p. 54). Even Norris, in his *Theory of the Ideal World*, repudiates the ideal theory with as much scorn, and in much the same style of lan-

guage as Reid himself (pp. 184, 5). He sneers at this pretty metaphysical furniture, as he styles it. He inquires how the action of external bodies could make such fine engravings and artificial images of things upon the fluid brain. He laughs at the notion that the head of a man should be like a gallery hung round with pictures. He wants to be informed, in fine, how a corporeal image, consisting of material lineaments, should be the immediate object of thought, or be any way, by itself, intelligible to the mind, or how body should be enabled to enlighten spirit.

What, then, becomes of the great discovery of Reid? It is clear that the entity-idea which he fancied he saw in the systems of the philosophers had no existence there. His whole philosophy in this respect was nothing but a blunder, and the philosopher was in the predicament of the astronomer who, with the dead fly on the glass of his telescope, imagined he had discovered a monster in the moon.

The causes which could have seduced so sage and sensible a writer into such a marvellous series of misconceptions may well be made the subject of inquiry, the more so as these causes still continue to operate insensibly upon the minds of both philosophers and critics, and, till detected and exposed, will never cease their operation. In the first place, then, there is always a something which, though unknown to consciousness, is intermediate between the perception and the things perceived—the *physical antecedent* of

sensation. Unless the ray alights upon the eye, unless the pulsation strikes upon the ear, there is neither sight nor sound. Hence the language of emission and impulse and impression; hence the supposition of vibrations and vibratiuncles in the nerves, of traces and motions in the brain. All these physical facts have abusively been named *ideas*, and it required the learning and the power of subtle distinction of Hamilton to show that the philosophers had distinguished between the cognitive reason within and the motion or image from without; between the species expressa of perception and the species impressa from the object; between the idea in the mind, of which we are conscious, and the idea in the brain, of which we have no consciousness whatever; between the idea which is an intellectual notion and the corporeal species which is the mere affection of the organ; between the sensible idea, which is properly styled an idea, and the material idea, which is a mere abuse of language.

But a still subtler cause of confusion is to be found in the language in which the psychological phenomenon itself, the idea proper, is expressed. Granting that the idea is nothing but a condition or an act of mind, the condition or the act of mind exists, and therefore may be denominated an *existence*. The ideas of the mind, accordingly, have been styled beings, existences, and things. They have been so denominated, for instance, by Malebranche, by Berkeley, and by Cudworth; they have occasionally been so denominated by Locke

and Hume. But, as Mill remarks, whenever we speak of an existence, we are apt to regard it as a separate existence; whenever we speak of a thing we are apt to regard it as a separate thing, and presume it to denote a substance. The operation of this principle is obvious in the case of Cudworth. An avowed disciple of Plato, he reproduces the theory of the Platonic ideas. He invests these ideas with certain immutable natures of their own. He attributes to them not only an eternal but a necessary existence. He confers upon them a constant and never-failing entity. He tells us that they always are, whether our particular minds think of them or not. He endows them with a constant being, and denominates them things. But what are the explanations of Cudworth—explanations which, doubtless, would have been those of Plato also? “The rationes or essences of things,” he says, “are not dead things, like so many statues, images, or pictures, hung up somewhere by themselves alone in a world; neither are truths mere sentences and propositions written down with ink upon a book; but they are living things, and nothing but modifications of intellect or mind.”

It is true that in the opinion of many philosophers the ideas of the mind which we style perceptions, though not conceived as having a separate, may still be conceived as having a *substantial* existence. They may be considered not as modifications of thought, but as modifications of mind; not as modifications of the mental action,

but as modifications of the mental substance. It was owing to this ambiguity of the word modification that Malebranche was misunderstood by Locke and Berkeley. It was owing to the same ambiguity that Locke himself was misunderstood by Hamilton. And though Reid does not seem to have distinctly considered this form of the ideal theory—though the idea he assailed was regarded by him as a separate entity, not as a substantial modification of the mind itself—there can be no doubt that the error operated insensibly on his judgment, and prevented him from seeing that the idea of the philosophers, like his own, was nothing but the mental act.

But what seems in a peculiar manner to have misled the mind of Reid was the philosophical employment of the words *object* and *objective*. Granting ideas to be mere states or acts of mind, the mind can turn inwards on itself, reflect on its own operations, and make those operations the object of reflective thought. As an object of thought, accordingly, philosophers denominated perception an idea; as a primary act of thought they left it the title of perception. But Reid, forgetting that in the philosophy of Locke the mind takes notice of its own operations, and that these operations are the appropriate objects of reflection—forgetting that Arnauld employed the word *objective* to denote the mental presence of a thought, as distinguished from the local presence of a thing (p. 296)—forgetting all this, Reid strangely imagined that the

philosophers, when they spoke of ideas as objects, necessarily regarded them as objects endowed with a separate existence, and that, accordingly, they maintained that the operations of the mind, like the tools of an artificer, could only be employed on objects which are present in the mind, or in the brain, where the mind is supposed to be residing (p. 277).

The sources of error already indicated have a tendency to vitiate our conceptions when we consider even the ideal systems of philosophy. But if it be held that the mind is conscious only of its own ideas, and if it be held at the same time that these ideas must nevertheless be regarded as *representative* of realities without the mind, then a new source of error and illusion rises. Cousin, who on this subject reproduces and systematizes all the misconceptions of all the preceding and succeeding critics, reduces the matter to a species of sorites. The recognition of ideas, he says in effect, supposes representation; all representation implies resemblance; all resemblance involves an image; every image comprises figure; figure is one of the qualities of matter; and therefore the ideas of the idealists are material idea-images. The same misconception operated on the mind of Stewart. From the word representation employed by Buffier, he says, "it would appear that even he conceived the idea or notion of the mind to bear a resemblance to the external corresponding object (*Works*, ii. 167). In the same manner he charges Leibnitz as holding the ideal

theory, because he held every human mind to be a living mirror of the universe (*Works*, i. 459). Nay, on the same ground he charges even Kant and the German school with holding the theory assailed by Reid. But the solution of this difficulty was obvious enough to the practised intellect of Hamilton. "If," he says, "we modify the obnoxious language of Descartes and Locke, and instead of saying that the ideas or notions of the primary qualities resemble, merely assert that they truly represent, their objects, that is, afford us such a knowledge of their nature as we should have, were an immediate intuition of the extended reality in itself competent to man—and this is certainly all that one, probably all that either philosopher intended—Reid's doctrine and theirs would be found in perfect unison" (*Reid*, p. 842).

The remaining cause of misconception in the mind of Reid was peculiar to himself. The sage of common sense was an unimaginative man. The great philosophers who had preceded him were not only profound thinkers, but they were men of deep feeling and poetic fancy. They delighted in comparing our ideas to the shadows flying over fields of corn. They dwelt on the pictures which were laid in fading colours on the mind. They described the flames of fever as calcining into dust the images which seemed as lasting as inscriptions graven on marble. With touching pathos they mourned over the ideas which die before us, like the children of our youth. They described our minds as represent-

ing the tombs to which we are hastening, where, though the brass and the marble may remain, yet the imagery moulders and the inscriptions are effaced by time. But the language of high poetry Reid took for sober prose. He mistook the play of the imagination for a form of spurious science. He converted a metaphor into a theory. He realised, in short, the fable of the fairy gifts—he received the fine gold of fancy and imagination and found it transmuted in his hands to lead.

It is difficult to conceive how Reid could, by any possibility, have imagined that, by a refutation of the theory of entity ideas, he was refuting idealism. So far indeed is the confutation of the ideal hypothesis from being a confutation of the sceptical argument that, as Brown observes, we have only to change the word *ideas* into the synonymous phrase *affections of the mind*, and the scepticism, if not stronger, is at least in strength exactly what it was before (*Lect.* xxviii). To attempt to confute the idealism of one who founds his argument on consciousness merely, and professes to have no knowledge of anything beyond it, would be as idle, to use the words of Brown, as it would have been for a Cartesian to attempt to confute the Newtonian system of attraction by a denial of the Ptolemaic spheres. But these considerations seem never to have occurred to Reid. The theory of ideas, he said, was the Trojan horse, which the philosophers had admitted within their walls, though it carried in it death and destruction to science and to common

sense (p. 132). It originated in a vain attempt to account for what is unaccountable (p. 326); it led to a demand for proof in the case of those elementary truths which could not possibly be proved (p. 306); and it ended in the denial of what could not rationally be denied (p. 109).

But this was not the only point of view from which Reid looked upon the question. Disbelief in the existence of a material world, he said, was not only an *error personae* which supposes a world made up of ideas, but it was also an *error juris*, inasmuch as it presupposed that we have no ideas but those of sensation and reflection (p. 128). If the senses furnished us with no materials of thought but sensations, he said, the conclusions of Berkeley must be just; for no sensation can give us the conception of material things (p. 313). Hume, he said, adopts Locke's account of the origin of ideas, and from that principle infers that we have no idea of substance, corporeal or spiritual, no idea of power, no other idea of a cause but that it is antecedent, and constantly conjoined to that which we call the effect (p. 294). To refute these paradoxes, he conceived it sufficient to show that there were 'certain principles which the constitution of our nature leads us to believe, and which we are under a necessity to take for granted in the common concerns of life' (p. 108). These were the principles of common sense, the foundation of which is laid in a class of natural signs which on the presence of a mere sensation suggest the conception of an object, and create a

belief in its existence (p. 122). This was a part of human nature which had never been explained (p. 122). This was a department of the mind which did not tally with any system of the human faculties which had ever been advanced (p. 126).

In thus virtually attributing the sensualistic doctrine to the great mass of the philosophers who preceded him, Reid was betrayed into a grave misconception, and into an injustice still more grave. Under a different name the conceptions which he regarded as the natural suggestions of the reason, and their concomitant beliefs, which he dignified with the name of the principles of common sense, had been recognised by the most eminent of his predecessors. The *ἰδέαι* of Plato, the *νοῦς* of Aristotle, the *ἐννοιαί* of the Stoics, the *lumen naturale* of the Schoolmen, the innate ideas of Descartes, the relative ideas of Locke, the rational ideas of Cumberland and Cudworth, and the notions of Berkeley, were in reality the same as Reid's conceptions.

But it is with reference to his three immediate predecessors that Reid's criticism is the most conspicuously unjust. As far as Locke is concerned, it is difficult to believe that Reid could ever have consecutively studied the Essay concerning Human Understanding. Like the other critics of Locke's philosophy, he would seem to have neglected to read the fourth book of the Essay in conjunction with the second; and in reading the second he would seem to have read no further than the opening chapter, which declares that 'all the *materials*

of reason and knowledge' are derived from experience, and that the only forms which human experience assumes are sensation and reflection. He seems to have had no notion of what Locke meant by 'simple ideas,' or by 'the origin of ideas,' or by 'ideas of relation,' or by 'knowledge' itself, as distinguished from its 'materials.' He seems, in short, to have had no glimpse of the fact that Locke regarded the conceptions of cause and substance as 'creatures and inventions of the understanding,' and that he attributed all our 'certain and universal knowledge' not to 'experience,' but to 'reason.'

Misunderstanding the philosophy of Locke, it is no wonder that Reid misunderstood the philosophies of Berkeley and Hume, and the relation in which they stood to Locke and to each other. He confesses that he found it difficult to understand what Berkeley meant by notions as distinguished from ideas (p. 289); and never dreaming that Berkeley's 'notion' was in reality his own 'conception,' he reduced it to a mere idea of imagination (p. 290). His misconception of Hume's psychology is more curious still. He never saw that Hume accepted Locke's theory of knowledge, though he rejected his theory of ideas; and he never saw that Hume accepted the principles of common sense as principles of action, though he refused to rely upon them as principles of speculative science.

The characteristic feature of Reid's philosophy is its attempt to convert the principles of common sense into an organon of the speculative reason.

And this opens before us a new vista for investigation. We have considered the critical portion of Reid's philosophy; let us now examine its constructive aspect. Did Reid admit the fundamental position of idealism, that the mind is conscious only of its own ideas? According to Brown, he did; according to Hamilton, he did not. Hamilton is 'decidedly of opinion that, as the great end, the governing principle, of Reid's doctrine was to reconcile philosophy with the necessary convictions of mankind, he intended a doctrine of natural, consequently a doctrine of presentative, realism; and that he would at once have surrendered every statement which was found at variance with such a doctrine' (*Reid*, 820). But the question is not what he would have surrendered, but what he actually held; and he systematically held that we have no presentative, no objective, knowledge of external objects. In fact, if he had surrendered this position, he would have abandoned the whole of his philosophy; so that here again the palm is carried off by Brown.

Reid, it must be conceded, in a variety of passages, asserts our knowledge of the external world to be *immediate*. But by the word immediate he does not mean, as Hamilton supposes, the negation of the intermediation of any third thing between the reality perceived and the percipient mind (*Reid*, 296); he merely means, as he himself tells us, that perception is 'the immediate effect of our constitution' (pp. 183, 332), and that 'it is not by a train of reasoning that we come to be convinced of the

existence of what we perceive' (pp. 259, 183). He expressly denies that there is any necessity for an 'immediate intercourse' between the percipient mind and the object of perception (pp. 302, 368). He expressly asserts that there are certain means and instruments, a certain train of machinery, that must *intervene* between perception and its object (pp. 186, 248). He repudiates, in fine, the theory which represents all our senses to be different modifications of *touch*, and describes it as 'a theory which serves only to confound things that are different, and to perplex and darken things that are clear' (p. 305).

In Reid's philosophy, in fact, touch itself is regarded as essentially subjective; for he holds that touch merely supplies us with 'certain sensations,' and that 'extension, solidity and motion,' are merely 'conceptions' which these sensations, by the constitution of the mind, 'suggest' (p. 111). And it is on this theory of *Natural Suggestion* that Reid's whole theory of perception rests. Hamilton, it is true, asserts that the theory of suggestion and natural signs, so explicitly maintained in the Inquiry, is not repeated in the Essays (*Reid*, 821). But this is not correct. Even in the Essays he holds that 'in perception, whether original or acquired, there is something which may be called the *sign*, and something which is signified to us, or brought to our knowledge, by that sign'; and that 'in original perception the signs are the various sensations, which are produced by the impressions made upon

our organs' (p. 332). In point of fact, Reid's theory of perception is identically the same in his earlier and in his later work. In both he holds that the presence of the object is *followed* by an impression on the organ, and that the impression on the organ is followed by a sensation, and that the sensation is followed by a perception, and that this perception is nothing but the conception of the object and a belief in its existence (pp. 186, 248). In both he holds that rays of light, vibrations of air, and effluvia of scent, must pass from the object to the organ before the impression is produced. In both he holds that the impression on the organ must be transmitted to the brain in order to produce sensation. In both he holds that there is not any necessary connexion between the sensation and the perception. In both he holds that 'we are *inspired* with the sensation, and we are inspired with the corresponding perception, by means unknown' (pp. 188, 329). In both he builds his philosophy on a system of natural signs, 'which, though we never before had any notion or conception of the thing signified, do suggest it, or conjure it up, as it were, by a natural kind of *magic*, and at once give us a conception and create a belief' in its existence (pp. 122, 332). In both he officially defines perception to be nothing but conception and belief (pp. 183, 318).

It appears, then, that Reid professes to have accomplished two results by his philosophy—first, to have superseded the ideas of the philosophers by conceptions; and, secondly, to have vivified these

conceptions by the beliefs of common sense. But, in thus resolving our knowledge of material things into mere conception and belief, Reid, it is evident, adopts the principle of the ideal theory which he rejects, and practically admits that in perception the mind is conscious of nothing but its own ideas. And this determines his philosophical position. On the basis of his idea he posits a cosmos; and is therefore what Sir William has termed, a *Cosmotheetical Idealist*. But the difficulty in the way of every system of cosmotheetical idealism is the same. How can we know that the idea truly represents the cosmos? How can we know that the picture is a portrait? How can we know that there is any original beyond the picture? Sir William Hamilton puts the difficulty with his usual point—‘How can we deny to the mind all immediate cognisance of matter, and yet confer upon it the inconceivable power of truly representing to itself the external world, which, *ex hypothesi*, it does not know?’ (*Reid*, 755; *Disc.* 66.) This is a crucial question for the philosophy of Reid—let us see how he attempts to meet it.

Reid’s immediate perception, as we have seen, is nothing but an immediate inspiration, and his natural realism is nothing but a natural magic. Let us consider his theory of perception, then, in its theological aspect as a *Divine Inspiration* (p. 329). His system compelled him to adopt the Cartesian theory of Divine Assistance; for he holds that our impressions are not the efficient cause of our per-

ceptions—that there is no necessary connexion between them—and that ‘we perceive because God has given us the power of perceiving, and not because we have impressions from objects’ (p. 257). And as he adopted the principal hypothesis of the Cartesians, so he adopted the subsidiary hypothesis by which they endeavoured to support it. He supplemented the theory of Divine Assistance by an appeal to the Divine Veracity to establish the veracity of the senses. If we are deceived in the evidence of the senses, he said, we are deceived by Him that made us (pp. 130, 329). But to have recourse to the veracity of the Supreme Being in order to prove the veracity of the senses, as Hume observes, is to make an unexpected circuit (*Works*, iv. 179). The existence of God is not clearer than the existence of the world; and if the divine veracity were concerned in the matter our senses would be infallible on every point. But the divine veracity is not concerned. The informations of sense are sufficient for all the purposes of life and action, but the Deity has given us no reason to believe that they are sufficient for any other purpose. For the purpose of discipline He has left us liable to error; and we have no reason to believe that we are any more exempt from error here than in any other department of human speculation. If we draw erroneous conclusions from the evidence of sense the fault is not in the evidence but in the conclusions which we draw. Poets may sing that ‘the voice of nature is the voice of God,’ just as politi-

cians may profess to hear the voice of God in the voices of the people. But philosophers should leave such platitudes to the politicians and the poets. The theory which Reid adopts from the Cartesians is only an instance of that unwholesome admixture of things, human and divine, which Bacon describes as the apotheosis of error, and which, he says, produces not only fantastic philosophy but heretical religion.

As the religious aspect of Reid's theory of perception is displayed in his theory of Divine Assistance, so its fantastic aspect is displayed in his theory of *Natural Magic*. There is a story in the Turkish Tales, which is told by Addison in one of the earlier numbers of the Spectator, which may illustrate the point in question. An unbelieving Sultan had ridiculed the famous passage in the Koran which records how the Angel Gabriel, having taken Mahomet out of his bed one morning, gave the Prophet a full view of hell, conducted him through the seven heavens of paradise, enabled him to hold ninety thousand conferences with God, and brought him back again to his bed before the bed was cold, and before the pitcher, which was capsized at the moment the Angel carried him away, was emptied. A doctor in the law, who had the gift of working miracles, undertook to convince the Sultan of the truth of this passage in the history of the Prophet. The holy man bade him plunge his head into a tub of water. The Sultan did as he was bid, and found himself

alone at the foot of a solitary mountain by the sea. He made for a forest which he saw in the distance, and met some woodcutters who conducted him to a neighbouring town. He married a lady of the land by whom he had seven sons and seven daughters. He was afterwards reduced to abject poverty, and was compelled to ply as a porter for his living. Walking one day by the seashore he was seized with a fit of devotion, and threw off his clothes with the design of performing his ablutions after the manner of the followers of the Prophet. He plunged headforemost into the water, rose to the surface, when, lo and behold, he found himself still standing by the tub, with the great men of his court around him, and the holy man, who had performed the miracle, beside him. He had not stirred from the place where he originally stood. He had been leading a magical existence—he had been enchanted. Told by Addison, to illustrate the doctrine of Malebranche and Locke as to the relativity of time, the story admirably illustrates Reid's doctrine of the natural magic of perception. By a stroke of magic the enchanted Sultan perceived the mountain and the sea. He perceived the forest and the sun. He conversed with the woodcutters, married his wife, and begat his sons and daughters. He had a vivid conception of all these various objects, and an unwavering belief in their existence. Everything was intensely real, and yet everything was mere illusion. He was the fool of a false conception and belief.

But leaving these fanciful speculations of Natural

Magic and Divine Assistance, let us direct our attention to the *Constitution of our Nature*. In the case of the belief in the existence of material things, as in the belief in the continuance of the course of nature, the belief, according to Reid, 'is not the effect of reasoning, nor does it arise from intuitive evidence in the thing believed; it is,' as he apprehends, 'the immediate effect of our constitution' (pp. 332, 209). Let us see what is the result of Reid's theory of perception regarded in this aspect of the question. 'It seems to be admitted as a first principle by the learned and unlearned,' he says, 'that what is really perceived must exist, and that to perceive what does not exist is impossible' (p. 274). But the possibility of perceiving what does not exist, in Reid's sense of perception, may be submitted to a crucial test. Astronomers tell us that there are fixed stars at such an immeasurable distance from the earth, that their light, with all its inconceivable velocity, takes a period of years to reach us. They tell us, also, that stars are extinguished and disappear for ever from the wilderness of worlds. Suppose, then, the case of an extinguished star. Suppose the rays which it emitted during the period immediately preceding its extinction to reach the earth. The ray would strike upon the organ, the impression would be followed by the sensation, and the sensation would be followed by the conception and belief which constitute perception. For years we should be forced by the constitution of our nature to form a conception of the non-existent star, and a belief in its existence.

According to Reid's theory we should perceive the non-existent star; and the non-existent star, because we perceived it, would exist.

Let us next consider the constitution of our nature, with reference to 'the more profound philosophy' of Hume (*Works*, iv. 176). Hume concedes to Reid that men are carried by a natural instinct or prepossession to repose faith in their senses, and without any reasoning to suppose the existence of an external world which has no dependence on perception (p. 177). But this prepossession involves something more than a belief that the external world exists. "When men follow this blind and powerful instinct of nature," as Hume observes, "they always suppose the very images presented by the senses to be the external objects, and never entertain any suspicion that one are nothing but representations of the other" (*ibid.*). The fact that such a supposition is made is attested by consciousness, and cannot for a moment be denied. If authority be required for the establishment of a fact so patent, take the authorities adduced by Hamilton (*Reid*, pp. 747-8). As Descartes remarks, we believe we see the torch and hear the bell. As Berkeley contends, the vulgar are of opinion that the things which they immediately perceive (that is, their perceptions) are the real things. As Schelling says, the man of common sense believes, and will not but believe, that the object he is conscious of perceiving is the real one. As Stiedenroth asserts, it appears as if the sense actually apprehended things out of

itself and in their proper place. Reid himself admits the fact as readily as Hume or Berkeley, as Stiedenroth or Schelling. "The vulgar," he says, "undoubtedly believe that it is the external objects which we immediately perceive, and not a representative image of it only" (p. 274). But this natural and irresistible belief is false. Hamilton admits it to be false, for he says we do not see the *sun*, 'but only certain rays in connexion with the eye' (*Reid*, 303). Reid admits it to be false, for, holding that we merely form a conception of the sun, and entertain a belief of its existence, he says, "that the object perceived is one thing, and the perception of that object another, I am as certain as I can be of anything" (p. 292). But everyone may be as certain as anyone can be of anything, that common sense and natural instinct confound the two. Men believe, and irresistibly believe, the conception of the thing to be the thing conceived. But this belief is confessedly erroneous. As Hume remarks, this universal and primary opinion of all men is destroyed by the slightest philosophy. Here, then, Reid is confronted with the dilemma of the sceptic. The opinion of external existence, if rested on natural instinct, is contrary to reason; and, if referred to reason, is contrary to natural instinct (iv. 181).

But we may test the constitution of the human mind, not only by the application of Hume's dilemma, but by reference to one of the 'repugnancies' of Berkeley. This is the second topic of 'the more profound philosophy' on which Hume insists; and

which he avowedly adopts from his immediate predecessor' (iv. 180). Reid, with the vulgar, considers it lunacy to question the existence of external objects (p. 274). But what is the external object of the vulgar? If the vulgar regard it as supremely ridiculous to prove by metaphysical arguments the existence of the earth, and sea, and sky (p. 306); they regard it as equally ridiculous to question whether the sky and the sea are blue, and whether the earth is decorated with all its tints, and shades, and harmonies of colour. Reid saw the difficulty, and endeavoured to evade it. "When philosophers," he says, "affirm that colour is not in bodies, but in the mind, and the vulgar affirm that colour is not in the mind, but is a quality of bodies, there is no difference between them about things, but only about the meaning of a word" (p. 139). The word *colour*, he says in effect, is both a quality in bodies and an appearance in the mind. But this is scarcely a fair statement of the case. The question at issue relates, not to the *cause* of colour, of which the vulgar never think, but to the *appearance* of colour, which can exist only in the mind, though the vulgar regard it as existing in the external object. What then, once more, is the external object? To the eyes of the vulgar it is something coloured and extended. To vulgar apprehension the colour is inseparable from the extension, and the extension is inseparable from the colour. No man of common sense will admit that the extended colour is within, and that the coloured extension is without. Accord-

ingly Berkeley contended that both colour and extension are within. What has Reid, the quondam Berkeleian, to reply? Again he is involved in a dilemma. He cannot assert that the total thing perceived exists *without*, for that would be an outrage upon reason; he cannot assert that the total thing perceived exists *within*, for that would be an outrage upon common sense. Again reason and natural instinct are at issue. In this division of the house against itself Reid, in the first instance, takes the side of reason; for he is as certain that our sensations are not like any quality of body as that the toothache has no resemblance to a triangle (p. 131). But as a set-off he again shifts to common sense; for he is as certain that the material world exists as he is that no quality of body can resemble our sensations. But what is gained by a compromise such as this? Suppose the existence of an external world of matter to be admitted on the authority of natural belief, what is the condition to which it is reduced by reason? Reid's compromise leaves it uncoloured, if not unextended. He degrades it to an unknown something, which is destitute of causal energy and force. He unconsciously identifies it with the *materia prima* of the Schoolmen. Again he falls into the hands of Hume. If you "bereave matter of all its intelligible qualities, both primary and secondary," says Hume, "you in a manner annihilate it, and leave only a certain unknown, inexplicable *something* as the cause of our perceptions—a notion so imperfect

that no sceptic will think it worth while to contend against it" (iv. 181).

What, then, is the position in which Reid's philosophy is placed by its appeal to *Common Sense* against the conclusions of the sceptic? On the question of the external world he is involved in vacillations as ridiculous as those in which Panurge was involved on the question of his marriage. Perplexed with the dilemmas with which he was posed by Hume, Reid resolved to take counsel of the common man, just as Panurge, when perplexed with the contradictions of the Ephectic and Pyrrhonian Philosopher, resolved to take counsel of the fool. But as the Pantagruelist found no more comfort from the fool than from the philosopher, so the sage of common sense found as little satisfaction in his morosoph as he did in the metaphysician whom he acknowledged as his master. His philosophy, in fact, was a constant see-saw between what common men call sense and what common men call nonsense. The vulgar, he says in reply to Hume, believe that we immediately perceive external objects; and in this division, to my great humiliation, I find myself ranked among the vulgar (p. 302). He turns the matter in his mind, and comes to the conclusion that perception is different from the thing perceived; and he abandons the vulgar, and ranks himself with the philosophers whom he had derided. The vulgar protest that the earth is green and that the sky is blue, and that the sea is the same colour as the sky, and Reid

is again found shifting to the vulgar (p. 138). The philosophers maintain that colour as perceived is nothing but a mere appearance in the mind ; and Reid acknowledges that a sensation is no more like a quality of body than a toothache is like a triangle, and finds himself a philosopher once more. He makes a last desperate attempt to reconcile philosophy and common sense, and distinguishes between colour as a perceived appearance in the mind and as an unperceived quality in body ; but both philosopher and vulgar repudiate the compromise, and the conflict between the reason of speculation and the common sense of practice is left as irreconcilable as ever.

While Reid was thus oscillating between reason and common sense, it is plain that, so far as he consulted reason, he was still almost, if not altogether, a Berkeleian. He agreed with Berkeley that we have no presentative or objective knowledge of the material world. He agreed with him that the object is not the efficient cause of the impression, and that the impression has no necessary connexion with the sensation by which it was immediately followed (p. 257). He admitted that our sensations, whether agreeable or disagreeable, are the same on Berkeley's system as upon any other (p. 285). He admitted that if sensation be produced the corresponding perception follows even where there is no object (p. 320). He admitted that ' we are inspired with the sensation, and that we are inspired with the corresponding perception '

(p. 188); and that our 'original and natural judgments,' as well as our 'notions or simple apprehensions,' are 'the inspirations of the Almighty' (pp. 209, 329). It is true he resolved perception into conception and belief, and on the authority of the belief which accompanies the conception of external things, seceded from his master. Yet even in insisting on the authority of belief, he was obliged to admit with Berkeley that belief may be erroneous (p. 320), and was fain to fortify it by an appeal to the veracity of God.

But as Reid, when he listened to reason, was a follower of Berkeley, so when he became a man of common sense he was merely a follower of Hume. In holding that the mind in perception is conscious of nothing but conception and belief, Reid conceded Hume's fundamental position that nothing can ever be present to the mind but an image or perception. In holding that there is no necessary connexion between our perceptions and material things, he conceded to Hume that the mind cannot attain to any *experience* of the connexion of material things with our perceptions. In holding, as he systematically held, that it is not by a train of reasoning and argumentation that we come to be convinced of the existence of what we perceive (pp. 183, 259), he in like manner conceded Hume's position that by no possible argument could it be *proved* that the perceptions of the mind must be caused by external and resembling objects. But as Reid conceded to Hume that the existence of the

external world cannot be established by argument, so Hume in his turn conceded to Reid that the existence of the external world is suggested by natural belief. He conceded in the amplest manner that men are carried by a natural instinct or prepossession to repose faith in their senses, and to believe in the existence of an external universe, which has no dependence on perception. But Hume insisted that this natural belief, though sufficient for the purposes of life and action, was insufficient for the purposes of science. He showed that it confounded perception with the thing perceived. He showed that it transferred to the thing perceived what was confessedly mere perception. He confronted it with its inconsistencies and its errors. He formulated his objections in his dilemma and his contradiction; and he called upon it to vindicate its character, and to substantiate its claims to be regarded as the oracle of truth. But, again, Reid virtually admitted everything for which Hume contended. He admitted that the process of perception could not possibly be explained (p. 326). He admitted that the mystery of sense was involved in impenetrable darkness. All he had to say was, what was virtually said by Hume, that in spite of all the contradictions and inconsistencies of sense, the statesman continues to scheme, the soldier to fight, and the merchant to buy and sell, without being affected by the reasonings of philosophy; and that a man might as well attempt to draw the moon from its orbit as to

destroy our belief in the existence of external things (p. 329).

It is evident, therefore, that Brown's opinion as to the relation in which Reid stood to Hume is critically correct. The sceptic and the orthodox philosopher arrive at precisely the same conclusion. "The creed of each," says Brown, "is composed of two propositions, and of the same two propositions—the first of which is, that the existence of a system of things, such as we understand when we speak of an external world, cannot be proved by argument; and the second, that the belief of it is of a force which is paramount to that of argument, and absolutely irresistible" (*Lect.* xxviii.). Brown proceeds to state the difference between the two philosophers in his Lectures; but he stated it far more pointedly in conversation. When talking on the subject with Mackintosh, he agreed that the difference between Reid and Hume was more in words than in opinion. Hume, he said, shouted, we can give no reason for our belief in an external world, but whispered, we cannot help believing; Reid, on the other hand, shouted, we cannot help believing in an external world, but whispered, we can give no reason in support of our belief. This was the very distinction which Hume himself took when he said that the dispute between the sceptic and the dogmatist was verbal (ii. 537). Reid did not deny that there are insolvable difficulties with regard to the senses, though he maintained the absolute necessity of thinking and believing. Hume did not deny the

absolute necessity of thinking and believing, though he maintained that the difficulties with regard to the senses were incapable of a solution. The only difference between them was that Hume from habit, inclination or caprice, insisted on the difficulties, while Reid, for the like reasons, insisted on the necessity of our belief.

According to Kant, 'however harmless idealism may be considered—although in reality it is not harmless—it must still remain a scandal to philosophy to be obliged to assume, as an article of mere belief, the existence of things external to ourselves, and not to be able to oppose a satisfactory proof to anyone who may call it into question' (p. xl.). To this scandal Reid left philosophy exposed. Let us see how Kant proposed to obviate the scandal.

*Visae correptus imagine Formae  
Rem sine corpore amat.*

OVID.

THE opinion which Kant entertained of his own philosophical position is reflected in a passage from the preface to the *Instauratio Magna* which he prefixed to his own great work. He compared his *Kritik* to the *Novum Organum* of Bacon. Like Bacon, he claimed to have opened a new road to the human mind, and to have supplied it with fresh aids to knowledge. He demanded that men should regard his method, as not a mere opinion, but an *opus*. Let them know, he said, that we are not founding a sect, or system, but are laying the foundations of the happiness and dignity of man. Let them adopt the method, he said, and share the toil. Let them be of good cheer, and let them not con-

sider the task to be something endless, and beyond mortal reach, for in reality it is the end of an endless error, and its appointed term.

While Kant thus claimed to be the Bacon of the eighteenth century, he reproduced, in his own person, many of the characteristics of the great original whom he thought to rival. Like him he was animated by an intense egotism of genius. To read the works of Bacon, no one would suspect that he had been preceded by Telesio and Campanella, or that anything had been done by Galileo or Gilbert. To read the works of Kant, the reader would imagine that Descartes and Leibnitz were children in philosophy, that Locke had done nothing for the human understanding, and that Berkeley and Hume were honest, well-intentioned men who had mistaken their vocation. And it is this intellectual arrogance which is one of the secrets of his fame. His precise nomenclature, his systematic exposition, his philosophical epigrams, his bursts of eloquence, his flights of elevated thought, and, above all, his profound mastery of his subject—these constitute his real claims to the consideration of posterity. But a man of ability is generally taken for what he claims to be. Assumption is a source of authority. To speak confidently begets confidence; and the dogmatism of Kant, like the dogmatism of Hobbes, is one of the causes of the intellectual predominance which he has achieved.

But there are points of contact between the philosopher of Koenigsberg and the great English Chan-

cellor, which are far deeper and more significant than the points of resemblance to which we have alluded. When Bacon had set forth his method in the preface, from which Kant selected his motto, he sums up the matter in these weighty words:—*Atque hoc modo, inter empiricam et rationalem facultatem (quarum morosa et inauspicata divortia et repudia, omnia in humana familia turbavere) conjugium verum et legitimum, in perpetuum nos firmâsse existimamus.* In this passage Bacon states the whole aim of the inductive philosophy; and it might well have been selected as a motto for the philosophy of Kant. The transcendental philosophy, like the inductive, aims to effect a union between the rational and the empiric faculties. It refers all the disputes which had agitated philosophy to their estrangement; it sees the only hope of progress and improvement in their reconciliation; and the *Kritik of the Reason*, like the *Instauratio Magna*, to use the phrase of Bacon, is a mere *epithalamium* to celebrate their marriage.

The *Novum Organum* is an instrument for the advancement of physical science; but even in physical investigations Bacon, so strangely considered as the leader of the empiric school, is constantly insisting on the necessity of the initiative of the mind. Whether in the conduct of our experience, or in the process of induction—whether in interrogating nature in order to ascertain the fact, or in interpreting the answers of nature in order to ascertain the form—the mind, according to Bacon, must

invariably assume the lead with nature. In the interrogation of nature he accepted the maxim of Plato—*qui aliquid quaerit id ipsum, quod quaerit, generali quâdam notione comprehendit; aliter, qui fieri potest, ut illud, cum fuerit inventum, agnoscat?* In the interpretation of the evidence of nature, it was by the *anticipatio mentis* that the physical philosopher first caught sight of the *differentia vera*, the *natura naturans*, the *fons emanationis*, which the moderns style laws of nature, and which Bacon, in his determination to follow antiquity to the very altar, denominated forms.

But we must dig still deeper, and beneath the very foundations of the Baconian philosophy, before we discover the real point of contact between Kant and Bacon. Below the Baconian *anticipatio mentis* there is another and more latent anticipation. With his rapid philosophical insight, which seemed akin to inspiration, Bacon sketched the outlines of a universal science which he designated *Philosophia Prima*, and described as the mother of the rest. The different sciences, he said, are not lines springing from an angle, but they are branches shooting from a trunk which had its roots in nature. There are certain common notions and common principles which all the sciences involve. These common principles he called the *axioms* of philosophy; these common notions he named *transcendents*; and the First Philosophy was the repository, the receptacle, of these. A more remarkable anticipation of the language of the *Kritik of the Reason* can scarcely be

imagined. But it was also an anticipation of its aim. The transcendents which he enumerates in the fifth book of the *De Augmentis* are majus, minus; multum, paucum; prius, posterius; idem, diversum; potentia, actus; habitus, privatio; totum, partes; agens, patiens; motus, quies; ens, non-ens; et similia (c. iv). These evidently were the *categories* in their embryo state. Bacon, it is true, was infelicitous in the instances which he selected to illustrate his thought, and it is not without reason that Macaulay ridicules his illustrations. But Macaulay failed to see the true scope and comprehension of this remarkable First Philosophy of Bacon, which in reality was a foreshadowing of the Transcendental Philosophy of Kant.

The *Transcendental Philosophy*, as Kant described it, is the idea of a science which should contain a complete exposition of all the analytic and synthetic judgments, which, prior to experience, are presupposed in all our physical investigations. It is conceived as a system of all the principles of pure reason employed by the mind in acquiring a knowledge of the phenomena of nature (*Kritik*, 16, 17). Its relationship to the Baconian philosophy is recognized by Kant himself. The wise Bacon, he says, gave a new direction to physical studies. When Galileo experimented with balls of a definite weight on the inclined plane—when Torricelli caused the air to sustain a weight which he had calculated beforehand to be equal to that of a definite column of water—when Stahl, at a later period, converted

metals into lime and reconverted lime into metals by the addition and subtraction of certain elements—they recognized the importance of the truth which had been taught by Bacon, that reason only perceives that which it produces after its own design ; and that it must not be content to follow, as it were, the leading strings of nature, but must proceed in advance with principles of judgment according to unvarying laws, and compel nature to give an answer to its questions (p. xxvii.).

In all the physical sciences, in fact, there are certain principles, certain unvarying laws, which must be *presupposed*. Every minister and interpreter of nature assumes that all the changes which he observes take place in accordance with a law of succession and connexion, and that the law elicited from a mass of existing facts will continue to be the law of similar combinations whenever they recur. The illustrious chemists who tracked matter through its Protean transformations, and weighed the atmosphere, and detected the latent laws of light, and electricity, and heat, all of them assumed as the very basis of their speculations that the quantity of matter in the world is constant. The great geometers who observed the facts and ascertained the laws of the heavenly motions, and thus augmented the number of those mixed mathematics which Bacon with his prophetic vision had foreseen, all of them assumed that, even in the most inaccessible recesses of the universe, phenomena are subjected to the laws of time and space, and quantity and

number. Take the simplest objects of physical inquiry. What is the weight of smoke? We assume the quantity of matter in the world to be constant, and the answer is, subtract from the weight of the burnt wood the weight of the remaining ashes and you will have the weight of smoke (p. 139). What is the cause of the melting of a piece of wax? We assume that phenomena, as objects of experience, succeed each other in a settled order, and that they do not drift at random down the stream of time (p. 144); and the answer to the question is, that we know a priori that there must have been something—the sun's heat—preceding, which the effect follows according to a fixed law (p. 465). In short, as Kant observes, we have only to look at the different propositions which are commonly stated at the commencement of every treatise on physical science—those, for example, relating to the continuance of the laws of nature, the permanence of the quantity of matter, the vis inertiae, the equality of action and reaction, and the like—to be convinced that they form a science of pure physics which, whatever its extent, deserves to be separately expounded (p. 13).

The question of the origin of these transcendental principles was one which fell within the peculiar province of the Essay concerning Human Understanding. But though Locke's treatment of the subject is defective, he did not merit the reproach of Kant by attempting a *physiological* derivation or deduction (p. 73). While he held that our simple

ideas, the equivalent of Kant's intuitions, are derived from sensation and reflection, he held that our ideas of relation, which correspond with Kant's conceptions, are the creatures and inventions of the understanding. While he held that 'all the materials of reason and knowledge' are derived from 'experience' (II. i. 2), he held that 'our highest degree of knowledge' is that supplied by immediate intuition (IV. ii. 1; xvii. 14). He anticipated the division of our intuitive judgments into analytic and synthetic (IV. viii. 8), and furnished an 'infallible rule' by which the one might be distinguished from the other (IV. viii. 13). He anticipated the distinction of our synthetic judgments into judgments a priori, such as those of mathematics; and judgments a posteriori, such as those of experimental science (IV. iii. 29), and signalized their contrast by attributing the one to 'reason,' and the other to 'experience' (IV. xii. 9). He even anticipated Kant in enunciating the criterion by which rational and empiric knowledge are to be distinguished—the 'necessary connexion' and 'necessity' which are absent from all mere 'experimental knowledge' (IV. xii. 9), and the 'universality' which cannot be known 'from experience,' but is to be discovered only 'in our minds' (IV. iii. 31). Nor did Locke fail to see that even in our experimental knowledge there is an element which is not experimental. Having stated that 'in some of our ideas there are certain relations, habitudes, and connexions, so visibly included in the nature of the ideas themselves,

that we cannot conceive them separable from them by any power whatsoever,' he goes on to say that 'the things which, as far as our observation reaches, we constantly find to proceed regularly, *we may conclude* do act by a law set them, but yet by a law we know not, whereby, though causes work steadily, and effects constantly flow from them, yet, their connexions and dependencies being not discoverable in our ideas, we can have but an experimental knowledge of them' (iv. iii. 29). But Locke did not ask himself what right have we to 'conclude' that causes work 'steadily,' and that effects 'constantly' flow from them. He saw that this was a synthetic a priori judgment; but he did not ask himself how is such a judgment possible—he did not recognize the importance of the question.

Hume in this respect evinced a more inquiring spirit and a more penetrating genius than had been evinced by Locke. As Locke fastened on the conception of substance, so Hume fastened on the conception of causation; and as Locke had resolved substance into a collection of attributes, together with a supposition of something we know not what, so Hume resolved causation into a succession of phenomena, together with an anticipation of something we know not why. What is the origin of that anticipation? On this point, Hume, as we have seen, professed to have discovered no light in anything that he had read. "I have *found* that such an object has always been attended with such an effect, and I *foresee* that other objects, which are in appearance simi-

lar, will be attended with similar effects"—these two propositions, he said, are far from being the same (*Works*, iv. 42). The latter, in fact, was a synthetic a priori judgment. "Why past experience should be extended to future times, and to other objects, which, for aught we know, may be only in appearance similar—this," says Hume, "is the main question on which I would insist" (iv. 42). This question, it is evident, is identical with the question which Kant regards as 'the grand problem of transcendental philosophy' (p. 44)—'how are synthetical propositions a priori possible?' (*ibid.*). But Hume not only anticipated the problem—he anticipated the method to be pursued for its solution. The conception of causation cannot be educed from experience, he said, for experience only reveals the 'constant conjunction' of two objects in the past, whereas the conception of cause and effect involves the idea of their 'necessary connexion' in all time past, present, and to come. 'It is impossible,' he says, 'that any arguments from experience can prove this resemblance of the past to the future, since all these arguments are founded on the supposition of that resemblance' (iv. 46). Hume accordingly, as we have seen, arrives at the conclusion that 'the efficacy of causes lies in the determination of the mind,' as distinguished from a determination of the object (i. 222); and holds that when we draw an inference from one object to another, after the discovery of their constant conjunction, 'the necessary connexion depends upon

the inference, instead of the inference's depending on the necessary connexion' (i. 123).

The Kritik of Kant is nothing but a generalisation of this idea; and the full scope and significance of Hume's reasoning on the subject of causation cannot be more clearly brought into evidence than by reference to the reasoning of the Kritik. 'It has hitherto been assumed that our cognition must conform to the objects,' says Kant in his Second Preface; 'but all attempts to ascertain anything about these objects a priori, by means of conceptions, and thus to extend the range of our knowledge, have been rendered abortive by this assumption. Let us then make the experiment whether we may not be more successful in metaphysics if we assume that the objects must conform to our cognition' (p. xxviii.). 'Here,' says Kant, 'we propose to do just what Copernicus did in attempting to explain the celestial movements.\* When he found that he could make no progress by assuming that all the heavenly bodies revolved around the spectator, he reversed the process, and tried the experi-

\* The scope of Kant's astronomical illustration has been made the subject of dispute. 'It is with reference to this and the accounting for the a priori or necessary element in intuitions and concepts,' says Mr. Mahaffy in his Translation of Kuno Fischer's Commentary on the Kritik, 'that Kant in his Second Preface compares himself and his system to Copernicus, and to the *rotation of the earth* as discovered by him, not to the heliocentric

hypothesis, as Cousin and Professor Webb suppose' (p. 36). But though either the earth's rotation on its axis or its revolution round the sun would equally have answered his purpose, Kant himself refers to the central laws of the movements of the heavenly bodies (p. xxx.). It is strange anyone should have thought that it refers to 'the supposed laws of being as being, the fixed stars of metaphysics,' as Mr. Mahaffy seems to think (p. 37).

ment of assuming that the spectator revolved while the stars remained at rest' (p. xxix.).

Hume's argument, that a given conception cannot be given by experience, because all conclusions from experience are based on the conception, may be regarded as the formula of the *Transcendental Method*. That method lays it down that whatever is presupposed by experience must be regarded as necessary to experience, and as prior to experience, and as transcending experience, and therefore as *transcendental* and a product of the mind. The difference between this mode of reasoning and the ordinary procedure of the a priori school is obvious. The transcendental method does not argue that certain principles must be regarded as a priori because experience is incompetent to explain them; it argues that they must be regarded as a priori because they themselves are necessary to the explanation of experience. And this again shows the true character of the *Transcendental Criterion* (p. 21). The transcendental philosopher does not argue that certain principles cannot be educed from experience merely because they are necessary and universal; he argues that they are necessary and universal, because they are essential to the conception of that experience from which they are said to be educed. All this is involved in Hume's position, that the mental inference in causation is not determined by any necessary connexion in the objects, but that the supposed necessary connexion in the objects is merely the result of the mental inference.

But if Hume was the Copernicus of the new method of investigating the phenomena of the mind, Kant must be regarded as its Newton. While Hume applied the method to determine the nature and origin of a single conception, the *Transcendental Kritik* proposes to 'lay before us a complete enumeration of all the radical conceptions which constitute pure knowledge' (p. 17); and if it 'does not assume the title of *Transcendental Philosophy*, it is only because, to be a complete system, it ought to contain a full analysis of all human knowledge a priori' (*ibid.*), whereas it pretermits the consideration of our analytical a priori knowledge, and confines itself to the consideration of our synthetical a priori knowledge only (p. 16). The *Transcendental Problem*, therefore, which the *Kritik* of the Reason undertakes to solve is embodied in the question—how are synthetical a priori judgments possible? (pp. 12, 44); and in answering this question Kant traverses the whole domain of speculation, and completes the work of Hume.

The general principles of Kant's psychology, allowing for variations of language, are identical with those of Locke's. Pure Reason is a perfect unity (p. xx). There are two sources of knowledge which perhaps spring from a common but unknown root, Sensibility and Understanding (p. 18)—the one being a receptivity for impressions, the other a spontaneity in the productions of conceptions (p. 45). Intuitions and conceptions, therefore, constitute the elements of knowledge (p. 45). But as sensibility

and understanding may spring from a common root, so they can only operate in conjunction (p. 189). Without the one no object would be given; without the other no object would be thought (p. 46). Intuitions without conceptions would be blind; conceptions without intuitions would be empty forms (p. 46). Sensibility manifests itself under the twofold form of the external senses and the internal sense (pp. 23, 43); and understanding employs itself with the twofold aim of anticipating experience by means of its conceptions, in which case it retains its name as understanding, and of attempting to transcend the sphere of experience by means of its ideas, in which case it assumes the name of reason (p. 54).

The opening sentence of the *Kritik* contains the substance of the polemic against innate ideas with which Locke opens the *Essay concerning Human Understanding*. "That all our knowledge begins with *experience* there can be no doubt," says Kant; "for how is it possible that the faculty of cognition should be awakened into exercise otherwise than by means of objects which affect our senses, and partly of themselves produce representations, partly rouse our powers of understanding into activity, to compare, to connect, or to separate these, and so to convert the raw material of our sensuous impressions into a knowledge of objects which is called experience" (p. 1). But what, according to Kant, are the objects the knowledge of which we are thus supposed to be able to attain? "In whatsoever

mode, or by whatsoever means, our knowledge may relate to objects," says Kant, "it is at least quite clear, that the only manner in which it immediately relates to them is by means of *intuition*" (p. 21). Is Kant's intuition, then, objective? No. "Our mode of intuition," he says, "is not such as to give us the existence of its object"; for that is "a mode which, so far as we can judge, belongs only to the Creator" (p. 43). But though our mode of intuition does not give us the existence of the object, he holds that it is 'dependent on the existence of the object' for its manifestations, because it is 'possible only on condition that the representative faculty of the subject is affected by the object' (*ibid.*).

What, then, in the Transcendental Philosophy, is the object which affects the subject? and what is the subject which is affected by the object? Both are presupposed in Kant's conception of experience; and both, therefore, must be viewed as transcendental. Accordingly, throughout the *Kritik* of the Reason, Kant assumes the existence of a *Transcendental Object*, which he regards as the non-sensuous cause of our sensations (p. 309). It is true 'the transcendental ground of this unity of subjective and objective' constitutes 'the mystery of the origin and source of our faculty of sense'; and, therefore, he regards the transcendental object as a mere *nescio quid*, the nature of which we could not understand, though some one were found able to tell us what it is (p. 200). But it must be postulated by the understanding as 'the mental correlate of sensi-

bility' (p. 309). And hence it is that *phenomena*, or the sensuous existences which are the sole objects of our knowledge, present a double aspect—one turned to the object as a thing in itself, and the other turned to our own form of intuition (p. 33); so that the name of phenomenon is given to that which is not found in the object itself, but which is only found in the relation of the object to the subject, and forms our representation of it (p. 42). The conception of a *noumenon*, therefore, must be admitted as the correlative of phenomena; and, though such a conception is problematical, it is not only admissible, but must of necessity be admitted (p. 187). Phenomena *must* have a transcendental object as a foundation which determines them as representations (p. 333); and "to this transcendental object we may attribute the whole connexion and extent of our possible perceptions, and say that it is given and exists in itself prior to all experience" (p. 309).

As Kant assumes the existence of a Transcendental Object as the mental correlate of sense, so he assumes the existence of a *Transcendental Subject* as the mental correlate of thought (p. 239). But as he regards the one as a mere *nescio quid*, of which, beyond the fact of its existence, nothing can be known, so he regards the other as a mere unknown quantity, the equivalent of an algebraic  $x$ . The Transcendental Object and the Transcendental Subject are thus the two foci around which the Transcendental Philosophy revolves. But these

foci are invisible to the eye of sense, and the introduction of these metaphysical elements into the Kantian system does not exercise any influence on the purely psychological development of its world of intuitions, conceptions and ideas. Kant, indeed, gives us a *critical admonition* on the subject. "The transcendental conception of phenomena in space," he says, "is a critical admonition, that, in general, nothing which is intuited in space is a thing in itself, and that space is not a form which belongs, as a property, to things; but that objects are quite unknown to us in themselves, and what *we* call outward objects are nothing else but mere representations of our sensibility, whose form is space, but whose real correlate, the thing in itself, is not known by means of those representations, nor ever can be, but respecting which, in experience, no inquiry is ever made" (p. 28).

In thus asserting that space, as known to us, is a mere form of our sensibility, and not an independently existing thing, Kant separates himself from all previous philosophers, idealist and realist alike; and it is by the establishment of this proposition that the *Transcendental Æsthetic* professes to have proved "that all things intuited in space and time, and therefore all objects of possible experience, are nothing but *phenomena*, that is, mere representations; and that these, whether regarded as extended bodies or as series of changes, have no self-subsistent existence apart from human thought" (p. 307).

What, then, according to the transcendentalist, are Space and Time? By means of the external senses we represent objects as without us, and that in space; and, by means of the internal sense, the mind contemplates the phenomena of its internal state, and represents them as in time (p. 23). But our internal experience is only possible under the previous assumption of external experience (p. 167); for Kant holds, with Locke, that ideas of reflection must be preceded by ideas of sensation. Space, therefore, in this sense, is anterior to time. Time, moreover, is in a state of continual flow, while space is permanent, and determines things as such (p. 176). Let us, therefore, restrict our inquiry to space.

The theories as to the nature of *Space* advanced by the philosophers who preceded Kant were numerous and discordant. The Schoolmen had started a notion, which was afterwards adopted by Gravesande, that space is a self-subsisting but unthinking substance. Newton had broached the doctrine, which was afterwards developed by Clarke, that it is an attribute of the eternal and infinite existence. Locke had maintained that, though space is necessary to the existence of body, the two things are distinct; but, in reply to the question whether space is attribute or substance, had frankly answered that he did not know (II. xiii, 11, 17). Leibnitz regarded it as neither substance nor accident, and, defining it to be nothing but the order of things coexistent, reduced it to a mere relation. Berkeley, as we have seen, maintained that extension, figure, and

motion were only ideas existing in the mind (*Prin.* ix.), and that space was nothing but the absence of resistance (*Prin.* cxvi). Collier, in this respect, more philosophical than Berkeley, held that 'the quasi-externality of visible objects is not only the effect of the will of God,' but 'a natural and necessary condition of their visibility' (*Clavis*, 4). Hume, on the contrary, maintained that 'the idea of space or extension is nothing but the idea of visible or tangible points distributed in a certain order' (i. 80). And, finally, some fifty years before the publication of the *Kritik*, Law, the translator of the *de Origine Mali* of Archbishop King, anticipated the very phraseology of Kant, and, denying that the idea of space required any external *ideatum*, asserted that its *formality* existed nowhere but in mind, and had no foundation but the power which the mind possessed to form it (*Trans.* 7).

But what was a mere passing conjecture in the mind of Law was converted by Kant into a systematic exposition of the *Transcendental Ideality of Space*. To establish his point Kant employs the formula of Hume in a department of our mental phenomena in which Hume never dreamt of employing it. The idea of space, he said, does not represent any property of objects as things in themselves or any relation between them; for things in themselves are not presented to our intuition (p. 25). Neither is it a general conception; for the idea of space is one, and is not abstracted from a multitude of spaces (p. 24). Neither, he

said, can it be derived from our external experience; for before we can represent things as existing in space we must have the representation (p. 23). The representation, therefore, must be regarded as an a priori representation which serves as the foundation for all external intuition (p. 24). Accordingly Kant arrives at the conclusion that 'we find existing in the mind a priori the pure form of sensuous intuitions in general, in which the manifold content of the phenomenal world is arranged and viewed under certain relations' (p. 22). It is true 'we cannot convert the special conditions of sensibility into conditions of the possibility of things' (p. 26). It is true that empty space 'may exist where our perceptions cannot exist, inasmuch as they cannot reach it' (p. 158). But space in this sense is not an object of possible experience (*ibid.*); and 'in the human point of view,' space is nothing but a permanent form of sensibility in which the sensations with which we are transcendently supplied are moulded (p. 26).

The *Empiric Reality of Space* is the necessary consequence of its Transcendental Ideality (p. 27). The objects of external intuition, whenever they may be presented to us, 'must correspond to the formal conditions of sensibility existing a priori in the mind,' because 'without them they could not be objects to us' (p. 76). Phenomena in the future as in the past must necessarily correspond with the formal condition of sensibility, because it is only through such formal condition that phenomena exist

(p. 77). True the phenomenon has its twofold aspect; true it has relation to the transcendental object. But as long as the relation of the object to the subject is maintained (p. 42), as long as the unknown cause of our sensations continues to affect the senses, so long will sensibility, like the cloud in Comus, continue to 'turn forth her silver lining on the night,' and so long will the objective reality of our external intuitions as phenomena in space continue.

If empirical intuition is possible only through the pure intuition of space and time, it follows that what geometry affirms of the latter is indisputably valid of the former (p. 125). But the principle which accounts for the validity of our mathematical preconceptions accounts for their existence also. No synthetic a priori judgment would be possible except by means of some a priori determination of the mind, and the a priori determination of the mind is discovered in the forms of sense. In showing the transcendental ideality of space, therefore, Kant professes to have solved one portion of the grand general problem of the transcendental philosophy. He professes to have shown *how* synthetic a priori propositions are possible in mathematics by showing 'that we are in possession of pure a priori intuitions, namely, space and time, in which we find, when in a judgment a priori we pass out beyond the given conception, something which is not discoverable in that conception, but is certainly found a priori in the intuition which corresponds to the conception, and can be united synthetically with it' (p. 44).

But this solution, though true as far as it goes, is only a partial solution of the problem, even as far as mathematics are concerned. As 'understanding and sensibility, with<sup>1</sup> us, can determine objects only in conjunction' (p. 189), so 'in no other way than from the united operation of both can knowledge rise' (p. 46). The conclusions of the Transcendental Aesthetic, therefore, require to be supplemented by the *Transcendental Logic*. The Transcendental Logic finds lying before it the manifold content which the Transcendental Aesthetic presents in order to furnish material for the pure conceptions of the understanding; and the spontaneity of thought requires that the diversity presented by the senses should be examined in a certain manner, and connected together, so as to convert it into knowledge (p. 62).

The *Understanding* is variously defined by Kant as the faculty of thinking, the faculty of conceiving, the faculty of judging, and the faculty of rules. But in its most general character it is "nothing but the faculty of *conjoining* a priori, and of bringing the variety of given representations under the unity of apperception," or self-conscious thought (p. 83). It is only by a synthesis of *apprehension* that the manifold in any empirical intuition is combined into the object which we call a phenomenon (p. 98). It is only by a synthesis of *imagination* that the objects which we have once combined in apprehension are permanently associated as objects of experience (p. 63). It is only by a synthesis

of *conception* that the scattered data of experience are combined into a system of scientific knowledge, This threefold synthesis is the work of the understanding, and is presupposed in all a priori empirical cognition (p. 63). But even this synthesis necessitates a transcendental pre-conception. It is true we have no intuition of the mind as object; it is true the transcendental subject is an unknown quantity—an algebraic  $x$ . But in every act of synthesis, whether of apprehension, or imagination, or conception, the act is regarded as *mine*, and as performed by *me*. The unity of conception, therefore, involves the conception of a unity which Kant styles the *Originally Synthetic Unity of Apperception* (p. 81)—the *Transcendental Unity of Self-consciousness*, to indicate the possibility of any a priori knowledge (p. 82). This, in fact, is ‘the first pure cognition of the understanding’ (p. 85)—‘the supreme principle of all our synthetic judgments’ (p. 117). The original synthetic unity of apperception is ‘the form of the understanding’ in relation to ‘the forms of sense’ (p. 103); and accordingly the first lesson which the Transcendental Logic teaches is, that it is the supreme principle of the possibility of all *intuition* in relation to the understanding; just as the Transcendental Aesthetic teaches that the formal conditions of space and time are the supreme principle of the possibility of all intuition in relation to our capacities of sense (p. 84).

The synthetic power, which Kant thus attributes to the understanding, is merely the scientific

expression of what Locke and Hume had intimated in more popular language, when they said that the understanding has the power of perceiving, compounding, and comparing the simple ideas with which it is furnished by the senses, and that the ideas of substances are mere collections of the simple ideas which the understanding joins together. But Kant, in the *Transcendental Analytic*, advanced far beyond this point, and penetrated to the very centre of the subject. He gave an exact analysis of the various a priori conceptions which the understanding employs in dealing with its sensible intuitions, and also an analysis of the various synthetic a priori principles into which those various conceptions enter (p. 53). The *Analytic of Conceptions* professes to trace the pure conceptions of the understanding to their very germs and beginnings in the mind, until they are developed on the occasions which experience presents (p. 55). And the *Analytic of Principles* professes to show that 'a priori synthetical judgments are possible, when we apply the formal conditions of a priori intuition, the synthesis of imagination, and the necessary unity of that synthesis in a transcendental apperception, to a possible cognition of experience, and say: the conditions of the possibility of experience in general are at the same time conditions of the possibility of the objects of experience, and have for that reason objective validity in an a priori synthetic judgment' (p. 119).

The first thing to be studied, then, is the *Analytic*

*of Conceptions.* As the Transcendental Æsthetic professes to have proved that all objects of possible experience are nothing but *phenomena*, which have no self-subsistent existence apart from human thought (p. 307), so the Transcendental Analytic professes to have established that ‘the understanding is competent to effect nothing a priori except the *anticipation* of the form of a possible experience in general’ (p. 183). What, then, are the conceptions of the understanding by means of which it anticipates experience? Here, again, the subject diverges into two branches. The object of the Transcendental Discovery is to determine the precise number of these conceptions, and the object of the Transcendental Deduction is to show that without their aid all anticipation of experience would be impossible for us.

It is in the *Transcendental Discovery* that Kant’s claims as a discoverer in mental science are most conspicuous and least disputed. Bacon, it is true, had recognized the necessity of a *philosophia prima*, which was to be the repository of the conceptions and axioms common to all the sciences, and among his transcendents, had enumerated such conceptions as *majus minus*; *multum paucum*; *prius, posterius*; *idem, diversum*; *potentia, actus*; *habitus, privatio*; *totum, partes*; *agens, patiens*; *motus, quies*; *ens, non-ens*; and the like. Hobbes had followed the example of his master, and had acknowledged the importance of a *philosophia prima*, which should treat of such fundamental notions as body, time, place,

matter, form, essence, subject, substance, accident, power, act, finite, infinite, quantity, quality, motion, action, passion, and divers others, necessary to the explaining of man's conceptions concerning the nature and generation of bodies (iii. 671; vii. 226). Locke had divided our complex ideas into modes, substances, and relations; and had treated in successive chapters of space, of duration, of infinity, of power, of substances, of cause and effect, of identity and diversity, and of other relations. Berkeley had intimated the necessity of 'an inquiry concerning those transcendental maxims which influence all the particular sciences' (*Prin.* cxviii), and had talked in a vague way of the mind containing all, and acting all, and being to all created things the source of unity and identity, harmony and order, existence and stability (*Siris*, 295). Hume had accepted Locke's division of our complex ideas into modes, substances, and relations; and had classified relations under the heads of resemblance, identity, space and time, quantity and number, quality and degree, contrariety and causation (*Works*, i. 30, 98). But none of them, except Hume, had set any definite aim before them. They followed no guiding principle in their investigations. They fastened on one conception after another as they occurred, and their whole procedure was hap-hazard.

The understanding being the faculty of judgment, Kant conceived that by examining the forms of judgment he would be able to determine the number of the a priori conceptions of the under-

standing. It was this which supplied him with the *Transcendental Clue* (p. 56). Judgments, according to the logicians, can be contemplated under four aspects only,—those of quantity, quality, relation, and modality; and if a physical content be introduced into these forms of logic, a transcendental element, according to Kant, will be detected (p. 58). The sun is the centre of the planetary system; some of the planets are mere asteroids; all the planets revolve around the sun. What is involved in the words ‘the,’ ‘and ‘some,’ and ‘all’? Evidently the conceptions of unity, plurality, and totality. The earth revolves around its axis; the sun does not revolve around the earth; glass is a non-conductor. These judgments involve the conceptions of reality, negation, and limitation,—the limitation of a class of things, not by the presence, but by the absence, of a certain characteristic. If we assert categorically that gold has such and such properties, there is implied a conception of inherence and subsistence; when we assert hypothetically that if the sun shines the wax will melt, there is implied the conception of causality and dependence; and if we assert disjunctively that a thing is either this or that or the other, the coordination of the whole, and the reciprocal exclusion of each, involve a conception of community or reciprocity between agent and patient (p. 64). Finally, what is assumed in propositions such as these:—as a matter of fact, man *does* exist upon the earth; as a matter of possibility, life *may* be existent in

the moon; as a matter of necessary inference from what we have perceived, man *must* have existed in the glacial period? Clearly the conceptions of actuality, possibility, and necessity. This completes the tale. We have discovered the twelve *Categories of the Understanding*. These are the conceptions which guide the understanding in its anticipations of experience. These suggest the ruling principles which regulate and pre-determine the domain of knowledge. These are the *Di Majores* of the Kantian system.

Or consider the matter in another aspect. We may conceive an object as one, as many, or as at once both one and many; we may conceive it as an object of which something may be affirmed, or of which something may be denied, or of which something may be affirmed with an element of denial; we may conceive it as inherent in some substance, or as produced by some cause, or as reacting on other objects in the form of cause and substance; we may conceive it as possible, or we may conceive it as existent, or we may conceive it as necessary, that is, as existent from the mere fact of the possibility of its existence. We have thus the Categories of Unity, Plurality, and Totality; of Reality, Negation, and Limitation; of Substance, Causality, and Community of Action; of Possibility, Existence, and Necessity. These are the transcendental conceptions elicited from the Quantity, Quality, Relation, and Modality of the logicians. In each of the four classes the number of the categories is three, and

in each triad the third is the synthesis of the other two (p. 67). The four forms of judgment are thus like the four rivers of Paradise in the picture in the old Bibles. They are placed at right angles to one another, each with a convenient bridge erected in the middle, and the tree of knowledge, with the serpent round it, is planted in the centre of the four.

Why the Categories should be twelve and twelve only we can no more explain than we can explain why the functions of judgment should be four, or why the kinds of syllogism should be three, or why the forms of sensible intuition should be only two (p. 89). We can only answer that the fact is so. The Transcendental Discovery being completed, Kant proceeds to the *Transcendental Deduction*, the object of which is 'to show that these conceptions are a priori conditions of the possibility of all experience' (p. 78), considered as a system of empirical cognition (p. 160). But the categories are not in themselves cognitions, but are mere forms of thought for the construction of cognitions from given intuitions; so that from them alone no synthetical propositions can be made (p. 174). And this again raises the question, What are the synthetic a priori propositions which the physical sciences assume? And how are such judgments possible?

The *Analytic of Principles* is the complement of the *Analytic of Conceptions*. Fastening on the four forms of judgment, Kant discovers that 'all intuitions are extensive quantities' (p. 122)—that 'in all phenomena the real, or that which is an object of

sensation, has degree' (p. 125)—that 'in all changes of phenomena substance is permanent' (p. 136); and 'all changes take place according to the law of connexion of cause and effect' (p. 141); and 'all substances, in so far as they can be perceived in space at the same time exist in a state of complete reciprocity of action' (p. 156)—and, finally, that as a thing agrees with the formal, or coheres with the material and universal, conditions of experience, it is possible, real, or necessary (p. 161). These are the *Axioms of Intuition—the Anticipations of Perception—the Analogies of Experience—and the Postulates of Empiric Thought* (p. 121). Not only are these principles assumed in all our physical inquiries, but it would be impossible to form any system of physical science without assuming them. Unless we assumed that all phenomena are subject to the laws of mathematics (p. 125), unless we assumed that substance in the world of phenomena is constant (p. 137), unless we assumed that the sequence of phenomena is subject to the law of causation (p. 142), we could predetermine nothing whatsoever as to the phenomena with which we are to be presented (p. 141). This shows the true nature of cognition a priori. 'All cognition by means of which we are able to cognise and determine a priori what belongs to empirical cognition may be called an *anticipation*' (p. 126); and the principles which we are discussing are only 'rules of synthetic unity a priori by means of which we can *anticipate* experience' (pp. 160–1). By means of the Axioms of Intuition we know a

priori that phenomena, when presented to us, will conform to the laws of time and space (p. 125). The Anticipations of Perception enable us to '*fore-stall* experience' in its very matter, the sensation (p. 127). The Analogies of Experience are merely rules by means of which 'we *anticipate* our own apprehensions' (p. 155), and 'intuite the future by *anticipation*' (p. 164). Even in connexion with the Postulates of Empiric Thought the great objection to the existing systems of idealism was, that by not admitting time and space to be the forms of sense, they gave no objective validity to sensible phenomena, and left the mind without any rational ground for anticipating their recurrence (p. 166). In point of fact, it is only by the existence of the principles of the understanding which *anticipate* experience that our possession of synthetic a priori judgments is proved (p. 463); and, accordingly, the Transcendental Analytic, to repeat the words of Kant, "has this important result, to wit, that the understanding is competent to effect nothing a priori, except the *anticipation* of the form of a possible experience in general' (p. 183); or, as he elsewhere expresses himself, it shows 'how the mere logical form of our cognition can contain the origin of pure conceptions a priori—conceptions which represent objects antecedently to all experience, or rather, indicate the synthetical unity which alone renders possible an empirical cognition of objects" (p. 225).

Kuno Fischer, in his Commentary, tells us that

‘the whole summary of the Transcendental Analytic’ is contained in the proposition that ‘the pure concepts of the understanding are not produced by experience, but themselves *produce* experience, though they cannot produce any other cognition than experience’ (p. 129)—they produce its very objects like the forms of sense (p. 78). But Kant asserts the very opposite of this. He asserts that the conception of the understanding ‘does *not* produce the object as to its existence,’ but is only ‘a *priori determinative* in regard to that object’ (p. 77). It is true that the word *experience* is used in two senses by Kant, and sometimes in a single sentence. Thus in the opening sentence of the Kritik he says that ‘all our knowledge begins with *experience*,’ and then goes on to say that unless our senses were affected the powers of the understanding would not be roused ‘to compare, to connect, or to separate our representations, so as to convert the raw material of our sensuous impressions into a knowledge of objects, which is called *experience*’ (p. 1). Here it is evident that the word *experience* is used first as meaning sensuous impression, and afterwards as meaning scientific knowledge. It is in the latter sense that the word is used by Kant when he says that ‘the rules of the understanding’ form ‘the basis of the possibility of experience.’ “These rules of the understanding,” he says, “are not only a priori true, but the very source of all truth, that is, of the accordance of our cognition with objects, and on this ground, that they contain the basis of

the possibility of experience, as the complex—the *inbegriff*—of all cognition” (p. 179).

But this suggests another aspect in which the question must be viewed. If truth be the accordance of our cognition with its objects (pp. 50, 179), how can we guarantee the accordance of objects with our cognition? Our cognition can possess no ‘objective reality’ unless we are supplied with ‘intuitions to correspond with our conceptions’ (p. 201)—how, then, can we guarantee that our conceptions will be supplied with the corresponding intuitions? If experience in its higher sense is dependent on the categories for its possibility, it is plain that the categories are dependent on experience in its lower sense for their objective validity and confirmation (p. xxix). How is it, then, that the categories can be ‘the keys to possible *experiences*’? (p. 221). In fact, Kant himself suggests the problem. He raises the question, ‘how the categories can determine a priori the synthesis of the manifold in nature, and yet not derive their origin from her’—‘how it is conceivable that nature must regulate herself according to *them*’ when they have their origin not in *her* but in the mind (p. 100). He finds himself ‘involved in a difficulty’ when he is asked ‘how the subjective conditions of thought can have objective validity; in other words, can become the conditions of the possibility of all cognition of objects’ (p. 75). He puts it thus:—“That objects of sensuous intuition must correspond to the formal conditions

of sensibility existing a priori in the mind, is quite evident from the fact that without these they could not be objects for us; but that they must also correspond to the conditions which the understanding requires for the synthetical unity of thought, is an assertion the grounds of which are not so easily discovered; for phenomena might be so constituted as not to correspond to the unity of thought, and all things might be in such confusion that, for example, nothing could be met with in the sphere of phenomena to suggest a law of synthesis, and so correspond with the conception of cause and effect; so that this conception would be quite void, null, and without significance" (p. 76).

The solution of this enigma as Kant regards it (p. 100) is supplied by the Transcendental Object. Nature in its subjective aspect—*formaliter spectata*—may be regulated by the categories; but nature in its objective aspect—*materialiter spectata*—must be regulated by the object which is the non-sensuous cause of the phenomena presented to the mind (p. 309). 'To this Transcendental Object,' as we have been already told, 'we may attribute the whole connexion and extent of our possible perceptions' (p. 309). The action of this Transcendental Cause when 'phenomenized' is 'in perfect accordance with the laws of empirical causation' (p. 337). It is thus that objects are found to conform to our cognition (p. xxviii). It is thus that the anticipations of the understanding are confirmed by subsequent experience (p. xxix). Hence it is that when

the understanding supplies the conception, experience supplies the case (p. 120). Hence it is that phenomena are presented to us 'in harmony with the category' (p. 113). 'The categories never mislead us,' in short, because 'outward objects are always in perfect harmony therewith' (p. 394)—in the words of Hume, because there is 'a kind of pre-established harmony between the course of nature and the succession of our ideas' (iv. 65).

The consideration of the Transcendental Object leads us from the Transcendental Logic to the *Transcendental Dialectic*—from the domain of Physical Science to the domain of Metaphysics—from the region of anticipation which experience can confirm to the region of anticipation which admits of no confirmation from experience in our present state (p. xxix). Here the Understanding expands its Conceptions into *Ideas*, and assumes the name of *Reason*. The ideas of Kant are not, like those of Plato, the archetypes of things themselves (p. 221). They are nothing but the categories elevated to the unconditioned (p. 257), or rather, aspiring to an unconditioned which they cannot possibly attain (p. 311). They are necessary conceptions of reason to which no corresponding object can be discovered in the world of sense (p. 228), conceptions which carry their synthesis far above all possible experience (p. 263), and of the object corresponding to which we can have no knowledge (p. 235). And as the clue to the discovery of the categories was supplied by the forms of judgment, so the clue to

the discovery of the ideas is supplied by the forms of syllogism, to which all reasoning is restricted (p. 225). The three forms of syllogism correspond to the three categories of subsistence, causality, and community of action (p. 226); and, following the thread of these categories, metaphysicians have attempted to *demonstrate* the nature of the Soul, the World, and God.

The futility of all these attempted demonstrations, according to Kant, is evinced by demonstrating the impossibility of making any dogmatical assertion concerning any object which lies beyond the boundaries of experience (p. 250). All a priori knowledge, he says, is obtained either from the anticipation of possible experience or from the analysis of conceptions (p. 477). But 'in whatever way the understanding may have attained to a conception, the existence of the object of the conception cannot be discovered in it by analysis, because the cognition of the existence of the object depends upon the object's being posited and given in itself, apart from the conception' (p. 392). The objects which correspond to our ideas are not so given; for we have no power of intellectual intuition, and the intuition of the senses can never give the existence of an object in itself (p. 43). It is in vain, therefore, that the reason poised on the wings of its ideas attempts to transcend experience. As well might the dove attempt to pass beyond the atmosphere by which it is supported, and to extend its flight into the void.

The Transcendental Dialectic is only a development of the principles which are thus laid down. The *Rational Psychology* attempts to demonstrate from the very nature of thought that the Transcendental Subject is a substance—simple in its essence—identical through the whole period of its existence—and distinct from body (p. 239). But the conception of a thing which can exist per se only as a subject possesses no objective reality, because we can never know whether there exists any object to correspond with that conception (p. 244). The argument, therefore, is a mere *Paralogism of the Reason* (ibid.); and the transcendental illusion which gives it plausibility is found in the fact, that the unity of consciousness which lies at the basis of the categories is considered to be an intuition of the subject as an object, and the category of substance is applied to the fancied intuition (p. 249).

The *Rational Cosmology* which attempts to demonstrate the existence of a world resembling our ideas fares worse with Kant than the Rational Psychology. It not only begs the question, but in begging the question it finds itself involved in a variety of contradictions which are styled the *Antinomies of the Reason*. Whether Reason contemplates the composition, the division, the origination, or the dependence of phenomena (p. 260), so long as it supposes that it is dealing with things in themselves, it finds itself involved in a natural antithetic (p. 255). In the discussion of any one of these questions thesis

and antithesis spring from the Reason at the mere suggestion, just as the two serpents which tormented Zohab sprang living from his shoulder at the devil's kiss. Had the world a beginning or had it not? Does or does not every composite substance consist of simple parts? Is a free causality necessary to account for the phenomena of nature, or is no such free causality required? Does any absolutely necessary being exist or no? (pp. 266—284). As long as we suppose we are dealing with things in themselves, thesis and thesis may be with equal plausibility maintained. But the combatants are the victims of a transcendental illusion (p. 315). They fancy that the mere modifications of their sensibility are things subsisting by themselves (p. 307). Once informed that all they are conscious of is phenomenal, they will see that the first two antinomies are a contest about nothing (p. 313), and that in the second two the antinomy is only apparent, as it is not impossible that both the contradictory statements may be true—one, in the world of sense, the other, in the world beyond it (p. 346).

The Rational Cosmology recognizes the necessity of admitting the existence of a Transcendental Object as the unknown cause of our known sensations; and the recognition of this necessity is an inducement to the *Transcendental Theology* to identify the Transcendental Object, as Berkeley identified it, with God. But the fallacy of all attempts to prove the existence of God by way of demonstration is shown by the mere definition of

the conception of existence (p. 367)—by the fact that the existence of an object corresponding to a conception cannot be known by a mere analysis of the conception, and can only be shown by actual experience (p. 392). Hence it is that Kant describes the ontological demonstration which Descartes based on the innate idea of a God, as an illusive augmentation of our intellectual wealth by the addition of noughts to our account (p. 370). Hence it is that he describes the cosmological proof, which Leibnitz based on the idea of the contingency of the world, as the ontological demonstration in masquerade, an argument which had changed its dress and disguised its voice, for the purpose of passing itself off as an additional witness before the judgment-seat of reason (p. 372). The claims of the physico-theological argument, based upon the principle of final causes, are treated, it is true, by the critic of the reason with deference and respect (p. 382). But, according to Kant, this argument is merely an introduction to the ontological argument, which contains the only possible ground of proof possessed by the speculative reason for the existence of the Supreme Being (p. 383). Theoretically it is open to the various objections brought against its sufficiency by Hume. It reasons from the analogy of human art, and assimilates the creation of the world to the manufacture of a watch. At most it demonstrates the existence of an architect, but not the existence of a creator, of the world. At most, it proves the existence of a cause proportionate to the order and

harmony which we observe, but not the existence of a cause, omnipotent, omniscient, and omnipresent, such as that which reason sees in its supreme ideal. But beyond this, it is open to the one insuperable difficulty in the mind of Kant. The physico-theological argument is unable to bridge the abyss which yawns between reality and thought; and the physico-theologians, after following the path of nature and experience, suddenly turn aside and pass into the region of pure possibility, where they hope to reach, upon the wings of ideas, what had eluded their empirical investigations, and, extending their conceptions over the whole sphere of creation, imagine they have attained to the transcendent reality of which they are in quest (pp. 386, 7).

We have now traversed the whole domain of the Transcendental Philosophy, and pursued our way as best we could in the uncertain glimpses of the moon which illuminates that shadowy realm—

Quale per incertam lunam sub luce maligna  
Est iter in silvis.

In the *Transcendental Aesthetic* Kant professes to have established that all things intuited in space and time—all objects of possible experience—are nothing but phenomena, which, whether considered as extended bodies or as series of changes, have no existence apart from human thought (p. 307). In the *Transcendental Analytic* he professes to have shown that the understanding is competent to

effect nothing a priori except the anticipation of the form of a possible experience in general, and that, as that which is not phenomenon cannot be an object of experience, it can never overstep the limits of sensibility within which alone objects are presented (pp. 183, 225, 429). The *Transcendental Dialectic* professes to have demonstrated that "human reason, in one sphere of its speculation, is called upon to consider questions which it cannot decline, as they are presented by its own nature, but which it cannot answer, as they transcend every faculty which it possesses" (p. xvii); and teaches the lesson that it ought never to attempt to soar above the sphere of possible experience, beyond which there lies nothing for us but the incomprehensible inane (p. 429).

But it is with the Kantian philosophy as with the nether world of Virgil—there is a double exit; and as the Speculative Reason is the porter of the gate of horn which gives egress to mere shadowy shapes, so the *Practical Reason* is seated by the ivory gate from which living realities emerge. Though we surrender the power of 'knowing,' we reserve the power of 'thinking,' supersensible existence (p. xxxiii). There is nothing to prevent us from admitting that the objects which correspond to our ideas of the soul and God have an actual existence (p. 412). We are not only authorised, but we are in fact compelled to realise them, and to posit real objects corresponding to our conceptions, though we cannot be said to know them (p. 415).

Even in a purely theoretical connexion we may assert that we firmly believe in the existence of God, and in a future state, while, in the moral aspect of the question, we are irresistibly constrained to believe in those momentous facts (p. 501). The proofs which have been current among men in justification of these high beliefs not only ‘preserve their value undiminished,’ but ‘gain in clearness and unsophisticated power by the rejection of the dogmatic assumptions of the speculative reason’ (p. 251). The practical proofs derived from ‘the analogy of nature’ and ‘the moral law’ remain after the pretended demonstrations have been finally confuted. “This mighty, irresistible proof,” says Kant—“accompanied, as it is, by an ever-increasing knowledge of the conformability to a purpose in everything we see around us, by the conviction of the boundless immensity of creation, by the consciousness of a certain illimitableness in the possible extension of our knowledge, and by a desire commensurate therewith—remains to humanity, even after the theoretical cognition of ourselves has failed to establish the necessity of an existence after death” (p. 251).

What then has Kant the Destroyer—the *Alleszermalmender* as he is called by his countrymen—destroyed? He himself informs us. He has effected nothing but a ‘destruction of cobwebs’ (p. xxxviii). He has confuted all ‘metaphysical demonstrations;’ but he has left us ‘practical proofs’ to take their place’ (p. 251). He denies that we can have any ‘logical conviction’ in sup-

port of our belief in God and in a future state, but he admits that we may have a 'moral certainty' upon the subject (p. 502). He recognizes the fact as established on the subjective ground of sentiment which he refuses to regard as established on the objective ground of reason (*ibid.*). 'It is not the *matter* which may give occasion to dispute,' he says, 'but the *manner*'; and 'even after we have been obliged to renounce all pretensions to *knowledge*,' it is 'perfectly permissible to employ, in the presence of reason, the language of a firmly rooted *faith*' (p. 453). Faith fills the space left vacant by the reason (p. xxxi); and if Kant abolishes knowledge, it is only to make way for belief (p. xxxv).

When knowledge and belief are thus sharply contrasted, it may be well to examine a little more closely into the true character of knowledge, under the conditions of the Kantian system. For what is Kant's *Cognition*? Kant holds that we have no intuition but the intuition of the senses, and that besides the intuition of the senses we have no mode of cognition, except cognition by conceptions (p. 57). What, then, is *Cognition by Conceptions*? According to Kant, 'the conceptions of the understanding are cogitated a priori antecedently to experience' (p. 219); and, consequently, 'all cognition, by means of which we are enabled to cognize and determine a priori what belongs to empirical cognition, may be called an anticipation' (p. 126). Accordingly, as we have seen, the Analytic arrives at the result that

“the understanding is competent to effect nothing a priori, except the anticipation of the form of a possible experience in general” (p. 183). But what is the nature of *Anticipation*? It is not a mere conception of the intuition which will be presented, it is in reality, to use the words of Reid, a conception of the object accompanied by a *belief*. For what, in fact, is the category of substance but a belief that the phenomenal substance of the universe is constant? What is the category of causation but a belief that the succession of phenomena is subject to a constant law? What then is the difference in this respect between the conceptions of the understanding and the ideas of the reason? It is merely this. The conceptions of the understanding, being restricted to the domain of experience, admit of *confirmation*, while the ideas of the reason, attempting to transcend experience, admits of no confirmation in our present state (p. xxix).

Yet it is not exactly true that the ideas of the reason receive no confirmation from experience even here. There are certain principles of the reason which are assumed in physical investigations. With Occam and Leibnitz, Kant has propounded certain laws as to the multiplication of entities, the variety of species, and the continuity of forms, which he denominates the law of parcimony, the law of specification, the law of continuity, and the like (pp. 399-410). These laws, though merely ideas of the reason, have a physical significance and use. They are *presuppositions* that, amid the seemingly infinite

diversity of the phenomena of nature, there will be found a latent unity of fundamental properties (p. 400); presuppositions which impose upon the understanding the duty of searching for sub-species in every species, and minor differences in every difference (p. 402); presuppositions which have their source in reason, and to which no adequate object can be discovered in experience (pp. 404, 5). The laws in question are not laws of nature; they are *Maxims of Reason*—maxims which are not derived from observation of the constitution of the object, but are subjective principles arising from the interest which reason has in producing a certain completeness in its ideas (p. 408). And yet under the guidance of these principles experimentalists have determined the nature of the elements (p. 396), have reduced all salts to alkalis and acids (p. 400), have ascertained the various species of absorbent earths (p. 403), and have detected in the orbit of the planet and the trajectory of the comet the existence and the laws of the all-pervading and continuous force of gravitation (p. 406). It might have happened that reason, in thus following the path of its ideas, was pursuing a path contrary to that prescribed by nature (pp. 399, 405), just as it might have happened that phenomena might have been so constituted as not to correspond with our conceptions (p. 76). But in our actual experience it is not so. The preconceptions of these ‘anticipatory laws of reason,’ as Kant denominates them, are confirmed (p. 403). They are shown to

possess an 'objective, though undetermined validity' within the sphere of our actual experience (p. 407); and this proof of their validity inspires us with confidence in the other conclusions of reason, and leads us to believe that they too, in some future experience, may be eventually confirmed.\*

It is at this point that Kant's approximation to the philosophy of the Scottish school becomes apparent. Reid, as we have seen, had resolved sensible perception into conception and belief, and on the authority of mere belief had assumed the existence of an external world of matter. According to Kant, as we have also seen, it must remain a scandal to philosophy to be obliged to assume the existence of things external to ourselves as an article of mere belief, and not be able to oppose a satisfactory proof to anyone who may call the fact in question (p. xl). We are now in a position to examine how he proposes to remove this scandal to philosophy, and how he proposes to supply a satis-

\* How nature can regulate herself in accordance with the maxims of reason is presented by the most recent of the Kantian expositors as one of the most difficult problems in the *Kritik*. How nature must regulate herself in accordance with the principles of the understanding is a question proposed by Kant himself as a transcendental enigma. The two difficulties in reality are but one. Mr. Monck, in his *Introduction to the Critical Philosophy*, follows the German commentators, and answers the

question they suggest by saying that without these principles "nature herself (*i.e.* objects of experience) could not exist" (p. 152). I have already given my reasons for rejecting this solution of the difficulty, and shown that the word nature is ambiguous. But while differing from Mr. Monck in this respect, I take this opportunity of expressing my obligations to that acute metaphysician for the numerous hints and suggestions with which he has favoured me during the composition of the present essay.

factory proof of the existence of things external to ourselves.

Kant's 'strict demonstration of the objective reality of external intuition' has been strangely misunderstood. One class of commentators of whom Hamilton is the representative has fancied, that in opposition to the whole scope of his philosophy he attempted to demonstrate the existence of external things as existing in external space. Another class has supposed with Mr. Mahaffy that his object was merely to prove, in opposition to Descartes and Berkeley, that external perception was not mere imagination, and that phenomena were something more than mere appearance (*Fisch.* li). It is difficult to demonstrate the true nature of a demonstration which is left involved in such a mist of words; but the momenta of Kant's argument would seem to be as follows:—I am conscious of my own existence as determined in time; and all determination with regard to time presupposes the existence of something permanent in perception (p. 167). My existence in time is determined by my intuitions in space (p. 167); and space as the permanent form of my sensibility is permanent, and determines things as such (p. 176). But the permanent something which determines my existence in me cannot be the mere permanent intuition of space, because the permanent intuition of space itself requires to be determined. The external sense of which it is the form implies a relation to something real, which must affect the senses

before the form of external sensibility can be evolved (p. xl). There must, therefore, be something permanent in existence, as well as something permanent in representation (p. xli.)—something permanent in existence which is the cause of our representations (p. 167), and which can be no other than the transcendental object (p. 309). But if the transcendental object and the transcendental ideality of space be granted, the objective reality of external intuition, that is, its empirical reality, follows, as a matter of course; and the proof of ‘the objective reality of external intuition’ is all that Kant contemplates by his proof of ‘the existence of things external to ourselves’ (p. xl).

But Kant’s demonstration of the existence of things external to ourselves is in reality a demonstration that things external to ourselves, in the ordinary sense of the term, have no existence. It establishes that when the transcendental object acts it produces certain modifications of our sensibility, and that when these modifications are produced, they are moulded in the forms of sense, of which the transcendental ideality of space is the result. Thus moulded, they are mere *phenomena*, which have no existence apart from human thought; and it is the fundamental position of the Transcendental *Æsthetic* that these phenomena constitute the only objects of which we have experience (p. 307). It is true, as Hume observes, that by a universal and necessary belief men regard phenomena as things subsisting by themselves (iv. 178). But

Kant, like Hume, though in more learned language, stigmatizes this as a mere transcendental illusion. And this shows the true effect of the Kantian demonstration. It establishes the existence of things external to ourselves, by showing that, properly speaking, they are not external. It demonstrates the objective validity of external intuition by showing that, properly speaking, it is not objective. Kant professes to have removed the scandal to philosophy which, in his opinion, is involved in accepting the existence of things external to ourselves, as an article of mere belief; but he removes the scandal to philosophy of appealing to belief, by the greater scandal of denying the validity of the belief to which philosophy appeals.

It is true that by insisting that all our ideas of sensation are moulded in the forms of sense, and that the forms of sense are constituent and essential elements of human nature, Kant attempted to impart to the sensible world the reality of the human nature in which it is moulded, and by which it is projected into fancied space. But this does not free philosophy from the scandal of accepting the existence of things external as an article of mere belief. It is mere matter of belief that the constitution of human nature, in respect to its capacities of sense, will continue as it is. It is mere matter of belief that the transcendental object will continue to act in its accustomed manner. It is mere matter of belief that the quantity of phenomenal

substance will continue constant. It is mere matter of belief that the succession of phenomena will continue to be regulated by a constant law. The law of continuance itself—the law which, in the words of Bishop Butler, leads us to believe that all things will continue as they are, except in those respects in which we have reason to believe that they will be altered—even this fundamental law, by its very terms, is nothing but an expression of belief.

We are now in a position to form an estimate of Kant's theory of perception by comparing it with the various theories which he rejects. In the first place, he rejected, by anticipation, the *Presentative Realism* which Hamilton proclaimed. He held that the only manner in which our knowledge relates to external objects is by means of intuition (p. 21); and he held that our mode of intuition was sensuous merely, and could never give the existence of the object (p. 43). A fortiori he rejected the *Transcendental Realism*, which regards the mere modifications of our sensibility as things subsisting by themselves (p. 307). This was a mere transcendental illusion (p. 315)—a universal and primary opinion of all men, it is true, but one which, in the words of Hume, the slightest philosophy was sufficient to destroy (iv. 177). In the same way the principles of Kant's philosophy compelled him to reject the *Hypothetical Realism*, which supposes the existence of an external world corresponding to our ideas of extension. In the first edition of the *Kritik*, although

he maintains that we must admit the existence of something which, by affecting our senses in a certain manner, produces in us the idea of extension; yet he maintains that this something is not extended, impenetrable, or composite, because all these predicates only concern sensibility and intuition, in so far as we are affected by the transcendental object (*Fischer*, 341). In the *Prolegomena* he sarcastically exclaims, "I suppose I must say, not only that the representation of space is perfectly *conformable* to the relation which our sensibility has to objects, for that I have said, but also that it is quite *similar* to them—an assertion in which I can find as little meaning as if I had said that the sensation of red has a similarity to the property of vermilion which excites this sensation in me" (p. 56). In the second edition of the *Kritik* he states his opinion with respect to the fundamental nature of our sensuous cognition to be, "that the things which we intuite are not in themselves the same as our representations of them in intuition, nor are their relations in themselves so constituted as they appear to us" (p. 35). Whether Kant was consistent in making these dogmatic assertions may well be doubted. But his dogmatism goes still further. While he admits that objects corresponding to the psychological and theological ideas may possess 'an objective and hyperbolic existence,' he contends that there can be no objects corresponding to the cosmological ideas, because they are antinomial, and involve a contradiction (pp. 300, 412); and he

holds that this affords an indirect proof of the transcendental ideality of the phenomena of sense (p. 316).\*

And as Kant rejected these various forms of realism, so in recognizing the existence of a transcendental object, he repudiates that form of *Psychological Idealism*, which, ignoring the necessity of conceiving essential substance and efficient cause, regards the sensible world as a mere series of sensations, unsubstantial and uncaused. But he equally repudiated that form of Psychological Idealism which he variously described as *Material Idealism*, to distinguish it from Formal, and as *Empirical Idealism*, to distinguish it from Transcendental. Although Material Idealism recognized a cause by which our sensible ideas are produced, and a substance in which they inhere, it did not recognize the intuitions of space and time in which they are moulded, and thus left them, in his opinion, without form and void. It was upon this ground that he rejected the *Problematical Idealism* of Descartes, which, commencing with the famous *Cogito*, declared the existence of objects in space without us to be doubtful. According to Kant, it ignored the fact

\* The most intelligible and compendious comment on the Kantian philosophy which has hitherto been published is to be found in Kant's *Prolegomena to any Future Metaphysic which can claim to be a Science*, and Mr. Mahaffy has laid the philosophical world under great obligation by his translation of that work. To this translation Mr. Mahaffy has appended the

principal passages in the original *Kritik of the Reason*, which were altered in the second and following editions, and by so doing has demonstrated, against the German critics, that there is no substantial difference between the earlier and the later forms of the philosophy of Kant. The same passages are also given in his Translation of Fischer.

that our internal experience is determined by our external experience; and it ignored the fact that our external experience is determined by the Transcendental Ideality of Space.

In the same way he rejected the *Theological Idealism*, or, as he calls it, the *Dogmatic Idealism*, of Berkeley. Berkeley, it is true, admitted that all human experience must commence with sense, and recognized the existence of a non-sensuous cause of our sensations. But he held that space was the mere absence of resistance, and that absolute space was the mere phantom of the geometric mechanical philosophers. Hence he left our sensations without any natural bond or basis. Hence he represented the mind as entirely passive in the reception of its sensible ideas. Hence he reduced phenomena to mere appearance, and regarded the sensible world as a mere vanity of the Divine Art—a mere insubstantial pageant, such as that which the magician exhibited to Miranda in the enchanted isle. But this was not the only ground on which Kant objected to the Theological Idealism of Berkeley. Not only did Berkeley ignore the transcendental ideality of space; but he professed to determine the nature of the transcendental object. Kant, it is true, reproduces the main argument of Berkeley. “The world around us,” he says, “opens before our view so magnificent a spectacle of order, variety, beauty, and conformity to ends, that, whether we pursue our observations into the infinity of space in one direction,

or into its illimitable divisions on the other, whether we regard the world in its greatest or in its least manifestations, even after we have attained the highest summit of knowledge which our weak minds can reach, we find that in the presence of wonders so inconceivable language has lost its force, and number can no longer reckon, nay, even thought fails adequately to conceive; and our conception of the whole dissolves into an astonishment without the power of expression—all the more eloquent that it is dumb” (p. 382). But while Kant is compelled to recognize the existence of ‘something which is primal and self-subsistent—something which, as the cause of this phenomenal world, secures its continuance and preservation’ (*ibid.*), he refuses to recognize this primal and self-subsistent cause as God. He is prevented from so doing by the exigencies of his Dialectic. The principle of efficient causation, he says, is a principle without significance in the sensuous world (p. 374). It is impossible to discover any mode of transition from that which exists to something entirely different termed a cause (p. 390). The knowledge of the existence of an object depends upon the object’s being posited and given in itself, apart from the conception (p. 392). The fact is not susceptible of demonstration. It is strange that Kant should have forgotten that, on his own showing, what cannot be mathematically demonstrated may be practically proved. It is stranger still that he should have recognized the principle of efficient causation

when he assumed the existence of a Transcendental Object, but should have repudiated its authority when he came to prove the existence of a God.

Kant was more self-consistent when he declined to adopt the *Egoistical Idealism* of Fichte, and to hold that there is only one single substance in the universe—the Ego. We are told by Schwegler that Kant, in his first edition, stated it to be possible that the ego and the thing in itself, which lies behind the appearances of sense, might be one and the same thinking substance, and that in his second edition he expunged the conjecture (*Schw.* 220). But this is a mere misapprehension. In the second edition Kant repeats the language of the first. He gives a premonition that the two fountains of human knowledge may possibly spring from a common but an unknown source (p. 18). He states “that it is quite possible that the cause of our representations may lie in ourselves, and that we ascribe it falsely to external things” (p. 167). He considers that “that which lies at the basis of phenomena, as a thing in itself, may not be heterogeneous” from the object of the inner sense, the soul (p. 252). But he declined to accept an admitted possibility for an established fact. All the manifestations of our consciousness are determined by our external intuitions (p. 167); but though our external intuitions are determined by some transcendental object, we possess no intuition which gives the determining in ourselves prior to the act

of determination (p. 96). On the contrary, we have the consciousness, not of a determining, but only of a determinable, self (p. 241). In one passage Kant seems to agree with Berkeley, that the permanent something to which we are related cannot be 'something in us' (p. 167); but he subsequently modifies the statement, and contents himself with saying that this permanent cannot be an 'intuition in us' (p. xl). Nor could Kant consistently have made any dogmatic assertion on the subject. His official doctrine, constantly repeated, is expressed in language which admits of no dispute. He does not hold, as Fichte seems to have imagined him to hold, 'that sensation is to be explained by reference to a transcendental object independently existent without us' (*Schw.* 260). What he holds is, that the transcendental object which is the basis of phenomena is a mere *nescio quid* (p. 206). He insists that the transcendental ground of the unity of subjective and objective lies too deeply concealed for us, who know ourselves only through the internal sense, and consequently as phenomena, to be able to discover in our existence anything but phenomena, the non-sensuous cause of which constitutes the mystery of the origin and source of sense (p. 200). In fine, he persistently maintains, against Fichte as against Berkeley, that the transcendental object which is the cause of phenomena is 'an object of which we are quite unable to say whether it can be met with in ourselves, or out of ourselves—whether it would be annihilated together with

sensibility, or, if this were taken away, would continue to exist' (p. 206).

But while Kant thus protested his ignorance of the nature of the transcendental object, he entertained no misgivings as to the transcendental ideality of space. It is in this transcendental ideality that the peculiarity of his *Transcendental Idealism* is to be sought and found. It is true he admitted that the faculty of cognition could not be awakened into exercise unless our senses were affected (pp. i. 21, 45). It is true he held that our senses could not be affected except by the operation of some efficient cause (pp. 206, 333, 337). It is true he recognized as 'the non-sensuous cause of phenomena' (p. 309) 'a non-empirical and intelligible causality' which 'phenomenises' itself though it is not 'phenomenal' (p. 337), and which as transcending the sensations of which it is the cause may be styled the transcendental object (pp. 200, 309, 333, 337). But the transcendental object merely supplies the *material* of knowledge, and it is the transcendental ideality which supplies the *form* (p. 36). Our sensations are nothing till they are moulded in the forms of sense. Accordingly Kant contended, not only that the rainbow with its various colours has no existence, except in the mind, but that even the raindrops themselves, with their globular form and the space through which they fall, are merely fundamental dispositions of our sensuous intuition (p. 38). It was by the establishment of this that the Transcendental Æsthetic established the fundamental position

of Transcendental Idealism, which proclaims that all things perceived by us in space and time, and therefore all objects of any experience which is possible to us—whether they be regarded as extended bodies, or whether they be regarded as series of changes—are nothing but phenomena which have no existence apart from human thought (p. 307).

Kant tells us that we are not justified in converting the forms of our sensibility into conditions of the possibility of things (p. 27). He tells us that he does not deny that empty space may possibly exist, though he holds that we cannot possibly perceive it (p. 158). But he maintains that, from 'the human point of view,' space is nothing but a form of human sensibility (p. 27); and that, though things may be related *in* space as a form of sense, they have no relation *to* space considered as a reality independent of the senses (p. 267).\* To test the doctrine which thus reduces space, from the human point of view, to a mere transcendental ideality, let us take the famous pas-

\* Mr. Mahaffy considers that I am wrong in my view of Kant's theory of space. In his Translation of Fischer's Commentary he says—"How, in the face of these reiterated assertions, Professor Webb could write (*Intellectualism*, p. 173), 'whether Kant held that space was nothing but a form of sensibility may be doubted,' seems to me marvellous. And the ground of the assertion is still more so: 'it is inconceivable that so systematic a thinker should have denied

the possibility of a knowledge of the objective, and yet dogmatically have affirmed the objective non-existence of what possesses empiric reality'" *Mahaffy's Fischer*, p. 55. But Kant expressly says that it is only from the human point of view that *we* can speak of space (p. 26); and he expressly says that he does not intend to combat the notion of empty space; for, he says, "it may exist where our perceptions cannot exist, inasmuch as they cannot reach thereto" (p. 158).

sage in the *Theory of Ethics* which is familiar to every student of philosophy. "Two things there are," says Kant, "which, the oftener and the more steadfastly we consider them, fill the mind with an ever new and ever rising admiration and reverence—the Starry Heavens above and the Moral Law within. Of neither am I compelled to seek out the reality, as veiled in darkness, or only to conjecture the possibility, as beyond the hemisphere of knowledge. Both I contemplate lying clear before me, and I connect both immediately with my consciousness of existence. The one departs from the place I occupy in the outer world of sense—expands, beyond the bounds of imagination, the connexion of my body with worlds rising beyond worlds, and systems blending into systems—and protends it into the illimitable times of their periodic movement, its commencement and perpetuity. The other departs from my invisible self, from my personality, and represents me in a world truly infinite, indeed, but whose infinity can be tracked out only by the intellect, and my connexion with which, unlike the fortuitous relation in which I stand to the world of sense, I am compelled to recognize as universal and necessary. In the one, the first view of a countless multitude of worlds annihilates, as it were, my importance as an animal product, which, after a brief and incomprehensible endowment with the powers of life, is compelled to refund its constituent matter to the planet—itself an atom in the universe—on which it grew. The other, on the contrary, elevates

my worth as an intelligence, even without a limit, and that through my personality, in which the moral law reveals the faculty of life independent of my animal nature, nay, of the whole material world—at least, if it be permitted to infer as much from the regulation of my being, which a conformity with that law enacts, proposing, as it does, my moral worth for the absolute end of my activity, conceding no surrender of its imperative to a necessitation of nature, and spurning in its infinity the conditions and boundaries of my present transitory life.”\*

This passage shows how difficult it is for any idealist to realise his own idealism, or to reconcile it with the unsophisticated view of common sense. For why contrast the moral law within with the starry heavens above, if the starry heavens above in reality exist within? Why talk of my connexion with worlds upon worlds, and systems upon systems, if worlds upon worlds, and systems upon systems, have no external existence, and are but modifications of myself? Why should the countless multitude of worlds annihilate my importance as an animal nature, when it is in my nature alone that all the countless multitude of worlds exists? How is the constituent matter of the animal product to be given back to the planet it inhabits, if the matter of

\* I have slightly modified the translation of this magnificent passage as given in Hamilton's *Discussions* (p. 310). A more literal translation is to be found in Kant's *Theory of Ethics*

or *Practical Philosophy*, by the Rev. T. K. Abbott, Fellow of Trinity College—another valuable contribution to the study of the Kantian Philosophy supplied by the University of Dublin.

which it is formed, and the planet which it inhabits, and the universe of which that planet is a speck, are all mere transcendental idealities, which have no existence whatever apart from human thought? And where is the majesty of the moral law in a world which exists only in idea? The moral law supposes me to be a member of a moral system—a system in which I am related to other beings, and in which each member has his rights and duties, and is under obligation to the others. But if there is no external world, there are no external bodies; and if there are no external bodies, what proof have I of the existence of other moral beings? How can I prove, or believe in, the existence of my fellow-creatures, if I cannot prove, and am not to believe in, the existence of the corporeal frames in which they are embodied, and by which they are revealed? On the principles of idealism not only is the sublimity of the contrast lost, but its very significance is gone. The starry heavens fade away into a sensuous image, and the empire of the moral law dissolves into a domain of dreams.

The imagination encounters still greater difficulties when it attempts to realise the purely idealist conception of *time*. Hegel ridicules the passage in which Haller describes eternity as awful, with its mountains of millions, its ages piled on ages. The only really awful thing about it, he says, is the awful wearisomeness of ever fixing, and anon unfixing, a limit, without advancing a single step (*Log.* s. 104). But the wearisomeness of the effort

to contemplate the everlasting Now, which is the only idea of objective time which the idealist admits, is quite as awful. The effort, moreover, from the very nature of the case, must prove abortive. We cannot divest ourselves of the idea of an objective time in which all objective change occurs. Changes are real. Time may be a mere form, in so far as it is the form of the continual change in our representations (p. 32). But there are objective changes. We ourselves, whatever we may be, begin to exist, and have therefore an objective beginning of existence. Of such an objective fact no subjective form can be the explanation. As far as we can judge objective changes can only occur in an objective time. Nor does Kant, when properly understood, deny the existence of such an object. It is true, he says that time is not something which subsists of itself (p. 30)—that if we take objects as they are in themselves then time is nothing (p. 31)—that time cannot be reckoned as subsisting or inhering in objects as things in themselves, independently of its relation to our intuition (p. 32). But, in this connexion, what are we to understand by *time*? According to the doctrine of the *Kritik*, time regarded as a real object is not presented to any of our perceptive powers (p. 30). As in the case of every other real object, the only mode in which our knowledge can relate to it is by means of our intuition (p. 21); and here, as elsewhere, our intuition, being merely sensuous, can never give us the object of intuition in itself (p. 43).

But if the object be not given by intuition, its existence, according to the teaching of the Kritik, can never be discovered by any analysis of our conceptions (p. 392). Time, therefore, as an absolute reality, is something which, for us, remains un-presented and unknown. It is only presented to us as a form of sense. Consequently it is only as a necessary representation lying at the foundation of all our intuitions of sense (p. 28), and all our conceptions of change (p. 29) that *we* have any cognisance of time. As the real form of our internal intuition, it is something real (p. 32), but this reality is not the absolute reality of a thing subsisting by itself (p. 34). To regard any mere modification of our sensibility as a thing subsisting by itself would be to maintain that obnoxious transcendental realism against which the whole Kritik is one continued protest (p. 307). As a form of intuition, therefore, time is nothing when abstracted from the phenomenon of sense (p. 31); as a form of intuition, it cannot be reckoned as an attribute of things (p. 32). But the existence of things in themselves is recognised by Kant, and in addition to the time which is a form of sense there *may be* a time which is an existing thing. If time, as an absolute reality, is not given, it does not follow that it does not exist. If time, as an objective existence, is not known, it does not follow that its existence may not be an object of belief. Kant has met all such inconsequential reasoning in advance. He answers both those who deny his doctrine and those who would extend

it. They do not reflect, he says, that both space and time, without question of their reality as representations, belong only to the genus phenomenon, which has always *two aspects*—the one, the object considered as a thing in itself, the other, the form of our intuition of the object (p. 33).

To conclude that space and time have no existence because we do not know them as existing would be to disregard the wisest lesson and the most earnest warning of the Kritik. True, the great metaphysician professed to have abolished metaphysics. True, he ridiculed the so-called science with all the richness of metaphor which his imagination could supply. It was a stormy ocean in which nothing could be discerned but the fog-bank and the mist. It was a Serbonian morass in which man could neither stand nor swim. It was a shadowy Walhalla which was the everlasting battle-field of shades. It was a Babel of confusion in which men, like the builders on the plain of Shinar, strove in vain to build them a city and a tower which might reach to heaven. But, in the opinion of Kant, the very severity of his criticism had rendered an important service to the interest of thought. By showing the impossibility of making any dogmatical affirmation concerning objects beyond the boundaries of experience it had fortified the mind against all counter affirmations (p. 250). If it had shown the inability of human reason to supply any demonstration of the existence of a Supreme Being, it had also shown the utter fatuity of denying his

existence (p. 393). If it had shown that mere reason is incompetent to demonstrate the freedom of the will and the immortality of the soul, it had shown that reason was equally incompetent to demonstrate that we are not immortal and that we are not free (p. 458). In fact, according to Kant, the greatest if not the only use of a philosophy of pure reason was to be found in its purely negative character (p. 482)—in the protection which its very negation of knowledge supplies to our practical beliefs in freedom, immortality; and God (p. xxxv).

But our practical beliefs in freedom, immortality, and God can scarcely be considered stronger than our practical belief in the absolute reality of space and time. The principles of space and time stand on the same level of authority as the principles of causation, which Kant recognises without reluctance or reserve. Kant admits that there is an objective course of physical causation which confirms all the anticipations of experience suggested by the categories of the understanding. He admits the objective existence of an efficient cause which operates beyond the region of mere physical causation, and which he styles the transcendental object. He even admits the validity of the principle of final causes, and again transcending the domain of nature, insists on the existence of a great first cause which sustains and regulates the world of sense (pp. 251, 382). In all these cases belief surpasses knowledge. In all these cases belief supplies a ground of expect-

tation and a principle of action. But what principle of action can be justified, if one of the most powerful of our practical beliefs is to be belied? The belief in the existence of space and time is as strong as any belief which the human mind can entertain and to give that belief the lie is to destroy all confidence in our faculties and to cut the very nerves of action.

The tendency of the mind of Kant was essentially idealistic. It was his boast that the *Kritik* had struck at the root of materialism and destroyed the fatalism and atheism which are its malignant growth (p. xxxvii.). Nor was the boast unfounded. In spite of its loud appeals to experience, materialism is nothing but a form of metaphysic. The metaphysic of matter is as incapable of verification as that of mind. To convert the principles of experience into conditions of the possibility of things, and to reduce the universe to matter, is just as transcendent a procedure as that which appeals to the principles of thought, and affects to demonstrate the existence of the objects of our ideals and ideas (p. 474). Materialism may be one of the possibilities of things; but even if materialism be possible it does not exhaust the sphere of possibility (p. 474). There are other possibilities which are equally worthy of regard. It is possible, for instance, that our actual life is nothing but a sensuous representation of a pure spiritual existence—that the sensible world is but an image hovering before our faculty of sense—that, if we could see ourselves as we actually are,

we should see ourselves in a world of spiritual natures, our connexion with which did not begin at our birth, and will not cease with the destruction of our bodies (p. 473). But Kant struck at the root of idealism as vigorously as he struck at the root of materialism (p. xxxvii.). Idealism, he said, is not to be obtruded as a dogma—it is not even to be regarded as a fixed opinion (p. 474). It is a mere *transcendental hypothesis* (p. 473)—a hypothesis which is not to be valued as an instrument of discovery, but as a weapon of defence (p. 472). As a weapon of defence it is available against the attacks of materialism, but that is all. It is a weapon which has not been steeled in the armoury of experience—its metal is not steel, but lead (p. 473).

But this wise reserve was contemptuously disregarded by the philosophers of Germany who succeeded Kant. They professed to be in earnest about idealism. They proclaimed the transcendental ideality to be the only valuable portion of the philosophy of their master. They denied that space and time had any ontological existence. They treated the principles of substance and causation as they treated the principles of space and time. They repudiated the transcendental object. Resolving the World into a sensuous phantom, and God into the moral order, Fichte declared the Ego to be the only substance (*Schw.* 267), while Hegel resolved the Ego itself into its ideas—left ideas without any origin in causation or any support in substance—made the Absolute Idea the sum total of existence

—and declared Absolute Idealism to be the last word of philosophy, the culminating point of human thought (*Schw.* 435).

But every revolutionary excess is followed by reaction. In opposition to these extravagances the Neo-Scottish school reverted to the principles of Reid. They recognised the practical authority of belief, and reasserted the objective validity of the principles of space and time, and substance and causation. But they also, with a certain reserve, adopted the principles of Kant. They admitted that unless the object were actually given, its existence could never be positively known; and they admitted that in whatever way our knowledge relates to material objects, it can only immediately relate to them by means of an intuition. But is our intuition merely sensuous? Is all our knowledge essentially subjective? Is it true that the object is never given to us in intuition? Is it true that the object is never actually known? These were the questions which engaged the attention of the Neo-Scottish school, and they cannot be more satisfactorily discussed than in connexion with the philosophy of Hamilton, its founder.

## HAMILTON.\*

*Tactus enim, Tactus, proh Divóm numina sancta !  
Corporis est sensus.*

LUCRETII.

THE history of philosophy is little more than a history of refutations. For upwards of two hundred years the church militant was thundering on the morion of Hobbes. A whole library might be formed of the answerers of Locke. The name of the antagonists of Hume is legion. But nowhere has this rage of refutation been more conspicuous than in the Scottish School. In the succession of

\* The substance of this Essay was originally published under the title of *The Metaphysician* in *Frazer's Magazine* for April, 1860, four or five years before the publication of Mr. Mill's Examination. Any coincidences, therefore, which may be detected

between the Examination and the present Essay are coincidences only. Those who travel the same road will see the same objects, and those who see the same objects will describe them in similar terms and make the same observations on them.

writers, by whom it is represented, we have not only a series of refutations, but a series of refutations in which the great man, who for the moment was lord of the ascendant, refuted the refutation of his predecessor. The philosophy of Reid was nothing but an attack on the speculative edifice which was reared by Hume. But as Reid refuted Hume, so Brown refuted Reid ; and as Brown refuted Reid, so Hamilton refuted Brown ; and as Hamilton refuted Brown, so the whirligig of time brought in its revenges, and Mill, in his turn, refuted Hamilton. The whole intellectual movement, in fact—if it is not beneath the dignity of the subject to employ such an illustration—is the exact counterpart of the performances of the cow, the dog, the cat, and the rat, which are celebrated in the jingling history of the House that Jack built.

Hamilton, after Hume, is the greatest of the metaphysicians whom Scotland has produced. He occupied a large space in the view of his contemporaries ; and of all his contemporaries none, perhaps, exerted a greater influence upon thought. Of the state of philosophy in the year 1833, when he first appeared as a writer, we cannot require better evidence than that of a celebrated work which was published in that year—the *England and the English* of the first Lord Lytton. According to that brilliant writer, it was the age of political economists. The stream of thought had been diverted into political science, and had left the fountains of metaphysics and of ethics dry. All the recent

moralists were of the school of Helvetius, and all the recent metaphysicians were of the school of Hartley. There was no idealizing school to counterbalance the attraction towards speculations which dealt with the unelevating practices of the world. The lamp of a purer naphtha, to use Lord Lytton's expression, was extinct. Compare this description with the present state of thought, and it will be seen how wide a distance separates the epochs. The lamp which was extinguished is re-lit. The fountain which had run dry is all afflow. Instead of metaphysics being material, physical science has become metaphysical. In this revolution by far the most conspicuous figure is that of Hamilton; and the power of his personality is evidenced by the influence which he exercised upon such minds as Mansel, and Fraser, and M'Cosh, and Veitch.

The first thing which strikes the student of the works of Hamilton is the appearance of stupendous learning. The philosophy of Aristotle and Plato, the mystical speculations of the Alexandrine and Arabian schools, the infinite subtilties of the Schoolmen, and all the developments of modern thought—whether British, French, or German—appear to be reflected in his mind. Nay, the physiologists and anatomists of all ages seemed to have been as familiar to him as the philosophers; and even on the question of the worms in the frontal sinus, when attacking the phrenologists, he could in his medical ignorance, as with the pride which apes humility he styles it, refer to authorities which he

could scarcely summon patience to recount (*Lect. i. 427*). But if we test his knowledge by a reference to the writers with whom we are familiar—if we test it by a reference to Locke, to Berkeley, or to Hume—it will be apparent that his learning was too multifarious to be precise. Take, for example, the case of Hume. Hamilton conceived that Hume had no philosophical principles of his own, but merely accepted the principles adopted by the previous schools. He did not see that while Hume rejected Locke's theory of the origin of ideas, he accepted his theory of the origin of knowledge. He did not perceive that on the question of the existence of an external world Hume recognised the practical authority of the common sense of Reid. He did not see that in his discussion of the question of causation Hume enunciated and employed the method which is deemed the discovery of Kant. He identified Hume with the sensualistic school, though Hume insisted on the a priori character of mathematics. He saw in Hume nothing but the sceptic, and even the nature of his scepticism itself he misconceived, identifying him with Pyrrho and with Sextus, instead of identifying him with Pascal and with Kant.

And yet the view of his enormous intellectual acquisitions occasions a feeling of regret that he did not employ them in satisfying the one great desideratum of the philosophic world. Studious, subtle, and systematic, the intellect of Hamilton was peculiarly fitted for the task of contabulating all the

various speculations of philosophers, exhibiting them in their mutual relations, and presenting a synopsis of the various systems. His analysis of all the possible theories of causation, and his analysis of all the possible theories of perception, show what he could have effected on a larger scale. But Hamilton mistook his mission. He aspired to be a great original thinker, and despised the humbler function of expounding the various possibilities of thought. He did not see that the resources of conjecture were practically exhausted, and instead of supplementing the work of Kant by giving the world a *Kritik of Systems*, he added to the confusion and the conflict which distract philosophy by elaborating a system of his own.

Regarded as a system, the philosophy of Hamilton presents an appearance which is strangely unsystematic. He seems to have been overwhelmed with the mass of his materials. His sentiments are to be collected with infinite labour by a collation of passages extracted from a variety of dissertations—historical, critical, and dogmatic. His works are full of repetitions, and inconsistent statements of opinion. Not one of them, in a literary point of view, is artistically complete. He had collected materials for a noble superstructure, but his philosophy presents the appearance of a builder's yard rather than the appearance of a building.

Unfortunately for his permanent influence, Hamilton was misled by his patriotic bias as a Scotchman, and mainly applied his genius to the service of

the Scottish School. With the self-abnegation of a Dumont, he devoted himself to the exposition and development of the philosophy of Reid—with this difference, however, that Reid was as inferior to Hamilton as Mirabeau and Bentham were superior to Dumont. But it was clearly impossible for a mind so enterprising and so energetic to confine itself within the narrow limits of the philosophy of common sense. It would have been strange, indeed, if the genius of Kant had not fascinated the imagination, and cast a spell over the intellect, of Hamilton. Hamilton, in fact, was a composite of Reid and Kant. His philosophy was a confluence of the two streams of speculation which had their fountain-head in Hume. But, like the rivers in the Iliad, the two incongruous tides would never mingle; and hence, while the professions of common sense, like the stream of oil, lay glistening on the surface of his philosophy, the Kantian stream, like the offshoot of the waters of the Styx, rolled deep and dark beneath.

The influence, however, which Reid exerted over the mind of Hamilton was so great that, in his view, it invested with paramount importance the primary question of Reid's philosophy—the theory of perception, and the proof of the existence of the world of matter. This question had been brought into prominence by Berkeley, and had been pronounced to be incapable of solution in the way of philosophy by Hume. Reid undertook to solve it. Hume's position was that the opinion of external

existence, if rested on natural instinct, is contrary to reason, and if referred to reason is contrary to reason, and at the same time carries no rational evidence with it, to convince an impartial inquirer of its truth (iv. 181). This position Reid undertook to turn; but his mode of procedure was peculiar. He conceded the premises of Hume. He conceded that in perception there is nothing present to the mind but the perception. He conceded that there is no immediate intercourse between mind and matter, and that we have no experience of the connexion between our perceptions and material things. He conceded that the existence of the world of matter cannot possibly be proved by reason. It is true he insisted on what Hume admitted—that we are irresistibly led by a natural instinct to believe in the existence of an external world which is independent of our perceptions; but it is equally true he admitted what Hume insisted on—that when we yield to this natural instinct we are irresistibly led to believe that our perceptions are themselves external. Reid, therefore, could not deny the existence of the conflict signalised in Hume's dilemma. All he could say was what had been previously said by Hume—that, conflict or no conflict, we must follow the instincts of our nature. It was the governing principle of his doctrine, according to Hamilton, to reconcile philosophy with the necessary convictions of mankind (*Reid*, 820); but his only resource was to disguise the conflict between

them by conferring on each of the conflicting principles the equivocal name of common sense.

The impossibility of basing a system of philosophy on common sense in any consistent meaning of the term is apparent from Hamilton's treatment of the subject. "Common Sense," he says, "is like Common Law—each may be laid down as the general rule of decision; but in the one case it must be left to the jurist, in the other to the philosopher, to ascertain what are the contents of the rule; and, though in both instances the common man may be cited as a witness, for the custom or the fact, in neither can he be allowed to officiate as advocate or judge" (p. 752). But Hamilton does not seem to have perceived the inevitable consequences of this distinction. For observe the results of the examination of the common man if he be cited as a witness for the custom or the fact on this question of perception. Undoubtedly the common man would depose, if he could express himself in the language of philosophers, that he believes the world to exist, because he is immediately cognisant of its existence (*Reid*, 750). But submit the witness to cross-examination, and what will be the result? He will inevitably admit to Hume that he believes the images presented by the senses to be the external objects (iv. 177). He will inevitably admit to Hume that the sensible qualities, such as colour, heat, and cold, which are mere sensations of the mind, are, in his opinion, inherent in the object

(iv. 180). He will admit, in fine, that he thinks he sees the sky above him, and the fields around him, and the fruit tree in his garden, and that to the best of his belief the sky is blue, and the fields are green, and the cherries on the cherry-tree are red. But these beliefs Hamilton admits to be at once inevitable and erroneous. He holds that it is incorrect to say that the sun, or moon, or stars are, or can be, perceived by us as existent, and in their real distance in the heavens (*Reid*, 299); and he repudiates the natural realism of the vulgar, which transfers our sensations of colour to the object (*Reid*, 816). But in admitting this, Hamilton admits everything for which Hume contends. He admits that reason and natural instinct are in conflict. He admits that what is common is not sense, and that what is sense is not common—that what is natural is not real, and that what is real is not natural. In short, he virtually admits that Common Sense and Natural Realism, as far as perception is concerned, are contradictions.

Nor is Hamilton more fortunate in his appeal to the philosophers on the question of law than he is in his appeal to the common man on the question of the facts. "For reasons to which we cannot at present advert," he says, "it has been almost universally denied by philosophers, that in sensitive perception we are conscious of any external reality—on the contrary, they have maintained, with singular unanimity, that what we are immediately cognitive of, in that act, is only an *ideal object* in the

mind itself" (*Disc.* 193). He repeats this in his edition of Reid (pp. 749, 817); he repeats it in his Lectures (i. 295). What then, according to Hamilton, is common sense? Not the common sense of the vulgar, for they are incompetent to form a judgment; not the common sense of the philosophers, for the judgment *they* pronounce is wrong. Hamilton's common sense, therefore, would appear to be merely the common sense of one uncommon man; and, as far as his immediate purpose is concerned, he is merely in a position to verify the saying which Voltaire borrowed from Buffier—that common sense is anything but common. The fact is, that common sense is incompetent to give any satisfactory answer either as to law or as to fact; and the appeal to such an authority can have no result but that of arraying the prejudices of the vulgar against the speculations of an opponent. It is not an argument addressed to a judge, neither is it the examination of a witness. To carry out the analogy, it is a mere speaking to the gallery—an appeal to the prejudices of the mob.

Abandoning the shifting ground of common sense, and taking his stand upon the ground of reason, Hamilton deviated from the procedure of Reid in dealing with the idealistic question. In reducing perception to mere conception and belief, Reid had unconsciously admitted that in perception there is nothing present to the mind but its ideas, and had gone off on a false track, misled by the idle fancy that the idea of the philosophers

was a *tertium quid*. Hamilton was too subtle to be betrayed into any such fiasco. He attacked Hume in his central position. Hume had laid it down as a principle, conceded by all philosophers, that, in perception 'the mind has never anything present to it but the perceptions and cannot possibly reach any experience of their connexion with objects' (iv. 177, 179). This Hamilton denied. 'In the act of perception,' he said, 'I am conscious of two things—of myself, as the perceiving subject, and of an external reality, in relation with my sense, as the object perceived' (*Reid*, 747). This he said was 'the cardinal point of philosophy' (*ibid.*), and it was to the establishment of this point that his philosophy of perception was devoted.

As this theory must be regarded as one of the permanent possibilities of speculative thought, it may be well to consider it in the various lights in which it was presented by its author. What Hamilton conceived himself to have conclusively established was a system of *Natural Realism* founded on 'the datum of the natural consciousness, or common sense, of mankind' (*Reid*, 816), which proclaims that 'in perception we are conscious of the external object immediately and in itself' (p. 866). He maintained that we have an *Immediate Knowledge* of the existence of the external world (pp. 750, 805). He maintained that we have *Intuitive Perception* of things, and that 'the mind, when a material existence is brought into relation with its organs of sense, obtains two concomitant and immediate

cognitions'—one 'the consciousness of certain subjective modifications in us, which we refer, as effects, to certain unknown powers, as causes in the external reality'; the other 'the consciousness of certain objective attributes in the external reality itself, as, or as in relation to, our sensible organism' (*Reid*, 820). He developed a doctrine of *Real Presentationism* which asserts 'the consciousness, or immediate perception, of certain essential attributes, of matter objectively existing, while it admits that other properties of body are unknown in themselves, and only inferred as causes to account for certain subjective affections of which we are cognisant in ourselves' (p. 825). What he advanced was a theory of *Dualistic Realism* the fundamental position of which is that 'our cognitions of extension and its modes are not wholly ideal—that although space be a native, necessary, a priori, form of imagination, and so far, therefore, a mere subjective state, there is, at the same time, competent to us in an immediate perception of external things, the consciousness of a really existent, of a really objective, extended world' (p. 840).

The theory of Natural Realism was intended to displace the *Hypothetical Realism* of the Cosmotheetical Idealists—a compromise between common sense and speculation, which was the favourite theory of the philosophers (p. 749), and which supposed 'that behind the non-existent world perceived there lurks a correspondent but unknown world existing' (p. 817). The Cosmotheetical Idealist

argues that 'the external world exists, because we naturally believe it to exist'; but this illation Hamilton conceived to be incompetent (p. 749). In a remarkable passage he contrasts his views on this subject with those of Reid. "Our belief of a material universe," he says, "is not ultimate, and that universe is not unknown. This belief is not a supernatural inspiration, it is not an infused faith. We are not compelled by a blind impulse to believe in the external world as in an unknown something; on the contrary, we believe it to exist only because we are immediately cognisant of it as existing. If asked indeed—how we know that we know it?—how we know that what we apprehend in sensible perception is, as consciousness assures us, an object, external, extended, and numerically different from the conscious subject?—how we know that this object is not a mere mode of mind, illusively presented to us as a mode of matter?—then indeed we must reply, that we do not in propriety *know* that what we are compelled to perceive as not self is not a perception of self, and that we can only on reflection *believe* such to be the case, in reliance on the original necessity of so believing imposed on us by our nature" (*Reid*, 750).

This resolves the question at issue between Hamilton and the philosophers into one of fact. We know that we necessarily believe in the existence of the material world. Do we necessarily believe that we know it as existing? To test the necessity of such a belief, let us take the condi-

tions of the possibility of such a knowledge as laid down by the natural realist himself. They are laid down with italicised precision. "A thing to be known *in itself* must be known as *actually existing*; and it cannot be known as actually existing, unless it be known as existing in its *When* and its *Where*. But the *When* and *Where* of an object are *immediately* cognisable by the subject, only if the *When* be *now* (*i.e.* at the same moment with the cognitive act), and the *Where* be *here* (*i.e.* within the sphere of the cognitive faculty); therefore a presentative or intuitive knowledge is only competent of an object *present* to the mind, both in *time* and *space*" (*Reid*, 809). Let us mark the consequence of this.

The first consequence is the exclusion of the whole *World of Vision* from the range of intuitive perception and immediate knowledge, and a divergence from the views of Reid and Stewart as to the object of perception (*Reid*, 814). If 'we are percipient of nothing but what is in proximate contact, in immediate relation, with our organs of sense,' it follows that we can never be said to perceive a distant object (*ibid.*). 'Distant realities we reach, not by perception,' says Hamilton, 'but by a subsequent process of inference founded thereon: and so far, as Reid somewhere says (p. 284), from all men who look upon the sun perceiving the same object, in reality every individual perceives a different object, nay, a different object in each several eye' (p. 814). 'Vision,' he says, 'is only a perception, by which we take immediate cognisance

of light in relation to our organ'; and 'the total object of visual perception is neither the rays in themselves nor the organ in itself, but the rays and living organ in reciprocity' (p. 160). Whether this be the total object of visual perception may possibly be disputed. It may be said that we see neither the organ nor the ray, whether in their reciprocity or in their isolation. It may be said that the total object of visual perception is the coloured and extended object which is seen. But how is it that we see the coloured and extended object? A ray alights upon the eye—an inverted image is depicted on a small expanse of nerve—and on the instant, as if by the touch of an enchanter's wand, an ideal universe exists. In this ideal universe the material reality is absent—the existence of the inverted image is unknown—the idea, the inference, is all in all. Vision is literally what Swift described it to be—the art of seeing things which are invisible. Malebranche was right in saying that the science of optics is merely an explanation of our optical illusions. The theory of Berkeley is triumphant, and the world of vision turns out to be nothing but the vision of a world.

And yet sight, if we regard the information which it conveys, is the most objective of the senses. "If," says Reid, "we shall suppose an order of beings, endued with every human faculty but that of sight, how incredible would it be to such beings, accustomed only to the slow informations of touch, that, by the addition of an organ, consisting of a ball and

socket of an inch in diameter, they might be enabled in an instant of time, without changing their place, to perceive the disposition of a whole army, or the order of a battle, the figure of a magnificent palace, or all the variety of a landscape" (*Works*, 133). It is no marvel that Reid should have regarded such a perception as a revelation, as an inspiration, as a species of natural magic. This language Hamilton denounces. "These expressions," he says, "in which the cosmothetic idealists shadow forth the difficulty they create, and attempt to solve, are wholly inapplicable to the real fact" (*Reid*, 749). But in visual perception the real fact, as stated by Hamilton himself, supplies their justification. Here at all events we cannot believe that we are immediately cognisant of the world of matter as existing. The world of vision, so far as it is perceived, exists merely in idea, and, natural realism, so far as it recognises the existence of a world beyond perception, is cosmothetic idealism, open and avowed.

Abandoning the world of vision, the natural realist takes his stand upon the *World of Touch*. "There is in reality no medium in any sense," says Hamilton, "and, as Democritus long ago shrewdly observed, all the senses are only modifications of touch" (*Reid*, 104). But here again let us attend to Reid. "If a man were by feeling to find out the figure of the Peak of Teneriffe," he says, "or even of St. Peter's Church at Rome, it would be the work of a lifetime" (*Works*, 133).

“The thing would be impossible,” says Hamilton—“let anyone try, by touch, to ascertain the figure of a room, with which he is previously unacquainted, and not altogether of the usual shape, and he will find that touch will afford him but slender aid.” (*ibid.*). On such slender aid, however, the natural realist is necessitated to rely. And what is the result? Once more, let us apply his own condition. Select the simplest phenomenon of touch. You touch an object with the tip of your finger; you have a sensation in the organ of sense: do you know the object? On Hamilton’s own showing, only if the percipient knows it in its *where*. But if, as the Cartesians held, the soul be seated on the pineal gland—if, like a spider in the centre of its web, it be localised at any point within the body—it is seated at a distance from the scene of sense. The informations of sense must be *telegraphed*, as it were, along the nerves, and the recognition of the object can never be regarded as immediate. Before, therefore, we can accept the doctrine of natural realism, we must reject the Cartesian doctrine, which centralizes the seat of thought—we must maintain that the soul is literally at our finger’s end—we must adopt the doctrine of Aristotle, that the soul contains the body, rather than the body the soul—we must embrace the dogma of the schools, that the soul is all in the whole body, and all in every of its parts (*Reid*, 861). But even this will not avail us. In order to cognise the object in its *where*, not only must we assume that the soul is at the finger’s end

—we must assume that the finger's end is in *contact* with the object touched. But if the theory of Boscovich be true—if matter be nothing but a system of acting and reacting forces—it is impossible that there should be any such thing as contact; and, on Hamilton's concessions, if there be no contact there can be no cognition. If the organ and the object be separated by the merest differential which the mind of the mathematician can conceive, it is evident that, for all purposes of intuition, they might as well be separated by what Norris calls the whole diameter of existence. Before we can accept the conclusions of natural realism, therefore, we must reject the theory of Boscovich, which reduces matter to a system of forces, and adopt the theory of Democritus, which not only reduces every sense to a modification of touch, but explains touch by a contiguity of atoms. But suppose the contiguity effected, we are as far from a cognition of the objective as ever. For what is contact? A mere community of surface, which of itself conveys no knowledge of diversity of being. "Suppose a man," says Hume, "to be supported in the air, and to be softly conveyed along by some invisible power, it is evident he is sensible of nothing, and never receives the idea of extension, nor indeed any idea from this invariable motion" (i. 82). Sense, therefore, might be in contact with an object, and yet receive no knowledge of its existence from the contact. If the object should exert pressure and evoke resistance

a new sensation would be determined, a new inference drawn; but consciousness would be affected, not by contact, but by pressure. Here, then, it is evident we must abandon atoms and have recourse to force; and as the theory of Boscovich was abandoned for that of Democritus to effect a contact, so the theory of Democritus must be abandoned for that of Boscovich to secure resistance.

And it is to force that Hamilton avowedly has recourse in order to secure the knowledge of a world without. "The existence of the *Extra-organic World*," he says, "is apprehended, not in a perception of the primary qualities of matter, but in a perception of the quasi-primary phasis of the secundo-primary; that is, in the consciousness that our locomotive energy is *resisted*, and not resisted by aught in our organism itself" (*Reid*, 882). This at first sight would seem to be the theory maintained by Brown. Brown virtually argues, "I am conscious of the feeling of resistance; in myself I am conscious of no difference; and I therefore infer the cause to be something not myself on the ground that a different consequent necessarily implies a difference of the antecedent" (*Lect.* xxiv.). But Hamilton denies that the conclusion rests on inference. "I am *conscious*," he says, "that my locomotive energy is not resisted by aught in my organism itself." That is the pinch of the whole question. As incubus originates within, though it appears to be an oppression from without, why may not the external world be what Fichte conceived it

to be, an *anstoss*, a self-limitation, in which the radiating activity of the ego is drawn backward on itself? (*Schw.* 268). "I cannot," says Hamilton, "be conscious of myself as the resisted relative, without at the same time being conscious, being immediately percipient, of a not-self as the resisting correlative" (*Reid*, 866). But why may not this correlative be the transcendental cause of Kant? Why must it necessarily be the material thing of Reid? "The experience of external resistance," says Hamilton, "supposes a possession of the notions of *space* and *motion* in space" (*Reid*, p. 882). But here the natural realist is involved in a dilemma. Is the notion of space a mere idea? Then external space, and all that it embosoms, may, for aught we know, be a mere objectification of a form of sense, a self projection of the mind, a mere metaphysical mirage; and natural realism is lost in the transcendental idealism of Kant. Is this notion of space an apprehension of space in its objective externality? In this case we believe in the existence of an external world of matter, because we believe in the existence of motion in an external world of space; and natural realism is enveloped in a mist of paralogism and again is lost.

In fact, the extra-organic world of touch, like the extra-organic world of vision, is at last avowedly abandoned to the cosmotheoretical idealist. "The primary qualities of things external to our organism," says Hamilton, "we do not perceive—i. e. *immediately know*—for these we only learn to *infer*, from

the affections which we come to find, that they determine in our organs; affections which, yielding us a perception of organic extension, we at length discover, by observation and induction, to imply a corresponding extension in the extra-organic agents" (p. 881). But how can we know that the extension of the extra-organic agent which *ex hypothesi* is unknown, corresponds to the organic extension which, for the moment, we may admit that we perceive? Here it is evident that Hamilton is betrayed into the very absurdity with which he constantly taunts his opponents, and which he regards as decisive of the fate of that form of philosophy which the cosmothetical idealist maintains. How can you deny to mind all cognisance of matter, he asks, yet bestow upon it the inconceivable power of truly representing to itself the external world which is *ex hypothesi* unknown? This was the argument which Hamilton constantly employed (p. 755). It was by this question that he demolished the Master of Subtilties (p. 815). It was by this question that he overwhelmed Descartes and Locke (pp. 839, 840). It was by this question that he annihilated Brown (*Disc.* 64). It was by this question that he held up the whole race of cosmothetical idealists and hypothetical realists to scorn (*Reid*, 749). But here his argument unexpectedly recoils upon his own philosophy; and it recoils with a peculiar force. The cosmothetical idealist does not profess to *know* that the idea corresponds to the unknown; he only

professes to *believe* it. The natural realist, on the contrary, professes to know that an extra-organic extension, which is confessedly unknown, corresponds with an organic extension which, as we shall see, itself escapes his knowledge.

Driven from position to position, the natural realist falls back upon the *Organic World*, the microcosm of the organs. 'The organism,' says Hamilton, 'is the field of apprehension, both to sensation proper and perception proper' (*Reid*, 880). And here again he calls upon us to concede a paradox. 'The organism,' he says, 'is, at once, within and without the mind; is, at once, subjective and objective; is, at once, ego and non-ego' (*ibid.*). 'Such is the fact,' he says; 'but how the immaterial can be united with matter, how the unextended can apprehend extension, how the indivisible can measure the divided—this is the mystery of mysteries to man' (*ibid.*). To preclude all confusion and ambiguity with respect to this cardinal distinction, Hamilton maintains that "our nervous organism, in contrast to all exterior to itself, appertains to the concrete human ego, and in this respect is *subjective, internal*; whereas, in contrast to the abstract immaterial ego, the pure mind, it belongs to the non-ego, and in this respect is *objective, external*" (p. 858). But even, in so far as our organism is objective and external, a discrimination must be made; for the body may be viewed as a body simply or as an animated body. Hence, while some of its phenomena are "to be considered as

*subjective*, being the modes of our organism as animated by, or in union with, the mind, and therefore states of the ego," there are other phenomena which are "to be considered as *objective*, being modes of our organism, viewed as a mere portion of matter, and in this respect a non-ego" (*ibid.*). 'As an animated body' our nervous organism, we are told, 'actually exists, and is actually known to exist, only as it is susceptible of certain affections, which, and the causes of which, have been ambiguously called the secondary qualities of matter,' while 'as a body simply it can possibly exist, and can possibly be known as existent, only under those necessary conditions of all matter, which have been denominated its primary qualities' (*ibid.*). Of these primary qualities we are conscious. Hamilton concedes that "by a law of our nature we are not conscious of the existence of our organism, consequently not conscious of any of its primary qualities, unless when we are conscious of it as modified by a secondary quality, or some other of its affections, as an animated body" (*ibid.*). But he holds that while the object of the one consciousness is merely 'a contingent passion of the organism, as a constituent of the human self,' which is recognised as 'a *subjective object*,' the object of the other consciousness is 'some essential property of the organism as a portion of the universe of matter'—a property which, 'though apprehended by,' is 'not an affection proper to, the conscious self at all,' and which, 'as a common property of

matter,' must be 'recognised to be an *objective object*' (*ibid.*).

But even from this position Hamilton finds himself necessitated to retreat. He is compelled to admit that, as far as our knowledge of the primary qualities of objects in immediate contact with our organs is concerned, our ignorance of their real magnitude is as complete as our ignorance of the magnitude of the most distant object. He acknowledges that magnitude appears greater or less in proportion to the different size of the tactile organ in different subjects; as an apple seems larger to the hand of a child than to the hand of an adult (*Reid*, 303). Experiment, he admits, establishes the curious fact that even in the same individual the same object appears greater or less, according as it is touched by one part of the body or by another (pp. 126, 303). In short he is compelled to allow that 'the magnitude perceived through touch is as purely relative as that perceived through vision or any other sense' (p. 885).

Nor, on Hamilton's own admission, have we any more accurate knowledge of the real extension of our organism than we have of that of objects in contact with our organs. Here again physiology is fatal to his claims. 'As perceived,' he says, 'extension is only the recognition of one organic affection in its outness from another' (p. 882). But, 'as a minimum of extension,' he continues, 'is thus to perception the smallest extent of organism in which sensations can be discriminated as plural; and as

in one part of the organism this smallest extent is perhaps some million, certainly some myriad, times smaller than in others; it follows that, to perception, the same real extension will appear, in this place of the body, some million or myriad times greater than in that' (*ibid.*). Hamilton, accordingly, admits that 'in no part of the organism have we any apprehension, any immediate knowledge, of extension in its true and absolute magnitude' (p. 881) — an admission which leaves no pretence for saying that we are, or can be, conscious of any essential property of our organism as a portion of the universe of matter.

As far, then, as our knowledge of the primary qualities of the universe of matter is concerned, the natural realist takes his final stand on the position that, 'Perception proper is an apprehension of the *relations of sensations to each other*, primarily in Space, and secondarily in Time and Degree' (*Reid*, 881). But whatever may be our ultimate opinion of the logical coherence or philosophic value of this theory of perception, it is evident that it is not the theory of perception which Hamilton originally led us to expect he would establish. The consciousness of the relations of sensations to each other is not the consciousness which gives us an immediate knowledge of the world of matter in itself (p. 747) as actually existing (p. 805), as existing in its when and where (p. 809). It is not 'the consciousness, or immediate perception, of certain essential attributes of matter objectively existing' (p. 825). It is not

‘the immediate perception of external things, the consciousness of a really existent, of a really objective, extended world’ (p. 841). It is not ‘the immediate knowledge or consciousness of the external object, *as extended*’ (p. 842). It is not the ‘sensitive perception,’ in which ‘the extension as known, and the extension as existing, are convertible—known, because existing, and existing, since known’ (*ibid.*). Indeed so far is it from being so that it is a perception in which extension as existing, whether in things external to our organism or in the organism itself, is confessedly unperceived, unapprehended, and unknown (p. 881).

Hamilton nevertheless contends that ‘an extension is apprehended in the apprehension of the *reciprocal externality of all sensations*’ (*Reid*, 885). He holds that “in the consciousness of sensations out of each other, contrasted, limited, and variously arranged, we have a perception proper of the primary qualities, in an externality to the mind, though not to the nervous organism, as an immediate cognition, and not merely as a notion or concept of something extended, figured, &c.” (p. 883). Nay he asserts that even when consciousness projects its sensations beyond the bounds of the existing organism into external space, as in the case of an amputated limb, the sensations thus falsely localised ‘being now, as heretofore, manifested out of each other, must afford the condition of a perceived extension, not less real than that which they afforded prior to the amputation’ (p. 861). But in what

sense can the extension thus perceived be said to be real? and in what sense can it be said to be external to the mind? As perceived, extension is defined to be the recognition of one organic affection in its outness—not from the mind, but—from another (p. 882). The term ‘outness,’ therefore, is used in the sense not of externality but of distance. To speak of the distance between one sensation and another is sheer nonsense; and, accordingly, the distance to be considered is the distance between one sentient point in the organism and another. But this is admittedly unperceived. All that we perceive is admittedly an extension which varies with the sentient mind—which differs with the seat of sense—which may be presented by a falsely localised sensation—which corresponds with nothing that is real in the proper acceptation of the term—and which, appearing in this part of the body some million or myriad times greater than in that, can be nothing but appearance. If this be so, what is presented to us is not extension but an idea of extension; and what Hamilton calls the intuitive perception of extension is only another name for what Kant has termed its empiric intuition.

If we wish to see how thin is the partition which divides the bounds of Hamilton’s intuitive perception from those of the transcendental ideality of Kant, we have only to examine the views of the Scottish philosopher with regard to *Space*. In his notes to Reid, he tells us that ‘we have a twofold cognition of space—an *a priori* or native imagin-

ation of it, in general, as a necessary condition of the possibility of thought; and, under that, an *a posteriori* or adventitious percept of it, in particular, as contingently apprehended in this or that actual complexus of sensations' (p. 882). In his Lectures, he designates this adventitious percept by the word *extension*, and reserves the term *space* for space considered as 'a form or fundamental law of thought' (ii. 114). But what is the source to which this adventitious percept is indebted for its advent? It is not furnished to the mind by the extension of external things; for Hamilton admits that the extension of external things is only an inference from *it*. Neither is it furnished to the mind by any organic extension; for Hamilton concedes that our actual organic extension is not apprehended by perception. The adventitious percept, therefore, must be essentially subjective—as subjective as the sensations of the relations between which it is the apprehension. We are led to the same conclusion if we consider Hamilton's theory of *space*. In the first edition of his Discussions he tells us that "it is one merit of the Philosophy of the Conditioned that it proves space to be only a law of thought, and not a law of things" (p. 582). True, in his second edition, published a year after the first, he modifies his statement. The merit of his philosophy, he says, consists in this—"that it proves space to be *by* a law of thought and not *by* a law of things" (p. 607). But in what sense can Hamilton maintain that space exists only by a law of thought?

As a natural realist he must maintain that, independently of our perceptions and conceptions, there is an external universe of things existing in an external infinitude of space. His proposition, therefore, must mean that it is only by a law of thought that space exists *for us*—that the space of consciousness is not a conception which has been derived from outward experience, or an intuition which presents any property of objects as things in themselves, or which presents their objective relations to each other (*Kritik*, 23–26)—in other words, that space, as known by us, is merely an evolution of the a priori form of sense, which Hamilton describes as a necessary condition of the possibility of thought. But if this be so, what is the doctrine of the natural realist but the doctrine of the cosmothetical idealist whom he derides? To use his own emphasised expressions, ‘the qualities which we call material—extension, figure, &c.—*exist for us* only as they are *known by us*; and, on this hypothesis, they are known by us only as *modes of mind*’ (*Reid*, 751).

The affinity which exists between the natural realism of Hamilton and the transcendental idealism of Kant will be brought into evidence if we view the subject in another light. Hamilton, as we have seen, resolves perception into an apprehension of *relations*. Now this is the very fact on which Kant relies as affording confirmation to his theory of the ideality of the external as well as the internal sense (*Kritik*, 40). He remarks that ‘all in our cognition that belongs to intuition contains nothing more

than mere relations' (*ibid.*); he observes that 'by means of mere relations, a thing cannot be known in itself' (*ibid.*); and he thinks 'it may be fairly concluded that, as through the external sense nothing but mere representations of relations are given us, the external sense in its representation can contain only the relation of the object to the subject, but not the essential nature of the object as a thing in itself' (*ibid.*). From this conclusion Hamilton recoils. He admits that in saying 'a thing is known in itself,' he does 'not mean that this object is known in its absolute existence, that is, out of relation to us'—'this,' he says, 'is impossible, for our knowledge is only of the relative' (*Reid*, p. 866). He admits that 'of things absolutely or in themselves, be they external, be they internal, we know nothing, or know them as incognisable, and become aware of their existence only as this is indirectly and accidentally revealed to us, through certain qualities related to our faculties of knowledge, and which qualities, again, we cannot think as unconditioned, irrelative, existent in and of themselves' (*Disc.* 643). He admits, in fine, employing the very phraseology of the *Kritik*, that 'all we know is phenomenal—phenomenal of the unknown' (*ibid.*). But instead of acquiescing in Kant's conclusion, that what is thus confessedly unknown is to human consciousness a mere *nescio quid*, he conceives that its nature is partially revealed to us through certain qualities related to our faculties of knowledge. But what are the qualities of external things which are thus related? Not

the primary qualities, for they are confessedly unknown (p. 881); not the secondary qualities, for, as manifested to us, they are merely phenomenal affections determined by causes which are essentially occult (p. 854). This brings the question to the very point to which it was brought by Hume—'bereave matter of all its intelligible qualities, both primary and secondary, and you in a manner annihilate it, and leave only a certain unknown inexplicable something, as the cause of our perceptions' (*Hume*, iv. 181).\*

Hamilton holds that, at all events, we have the perception of 'a resisting something *external to our body*' (p. 883). But it is as difficult to show that this something is external, as it is to show that it is extended. It is in reality something transcendental. Yielding to the coercion of the principle of metaphysical causality, Kant postulates its existence as an efficient cause; yielding to the natural instinct of the human race, Hamilton professes to apprehend it as an external object. Regarding it as an efficient cause, Kant accepts the conclusion of Hume (iv. 178), and insists that by no argument can

\* Since writing the above, I have had the privilege of reading Professor Veitch's valuable monograph entitled *Hamilton*, and it is a source of satisfaction to be able to cite the following passage from the work of the disciple, to show that in the foregoing criticism I have been guilty of no injustice to the master: "This reference [to the thing in itself]—what we may ask the Ontological—is, no doubt, the least explained point in Hamilton's

philosophy of Perception. Do we actually perceive and conceive in those primary qualities body as body, *per se*—as that which exists and subsists whether we perceive it or not—in its own actual, absolute reality—the transcendent thing in existence? My view is, that Hamilton says no to this question" (*Hamilton*, 145-6). Mr. Veitch even questions whether Hamilton held that perceived extension subsists after the act of perception (p. 179).

it be proved that our perceptions do not arise either from the energy of the soul itself, or from the suggestion of some invisible spirit, or from some other cause which is equally unknown (*Kritik*, 206). Regarding it as an external object, Hamilton accepts, in a modified form, the conclusions of Reid and Brown, and insists that its existence is given in the *consciousness* that our locomotive energy is resisted, and not resisted by aught in our organism itself (*Reid*, 882). But what is the consciousness to which Hamilton appeals? Undoubtedly, in the world of motion we seem to be resisted from without, and we seem to behold the very objects which resist us. But sight is, confessedly, mere inference, and why should we not regard this seeming of material resistance as mere inference also? The great philosophers who have written on the subject must be presumed to have known what they were conscious of, and to have been conscious of what they knew. And yet what are the philosophical conclusions as to the true nature of this resisting object? To Hamilton, it is true, it was a material thing; but to Berkeley it was a divine agent—to Fichte it was a subjective anstoss—to Kant it was a *nescio quid*—and to Hegel it was nothing. The philosophical difficulties which Hamilton's theory encounters are not less than those encountered by the theories of Berkeley and Fichte. The fact is, that Hamilton's criticism of Kant's only possible demonstration of the reality of an external world recoils upon himself, and he only reaches his external reality by a double *saltus*, which overleaps

the foundations of both the egoistic idealism and the mystic (*Disc.* 93).

In these interesting discussions, however, there is one point on which Hamilton is entitled to peculiar credit. He saw more clearly than any contemporary philosopher where the real pinch of the difficulty lay. He accepted the position of Kant, that "in whatever way the understanding may have attained to a conception, the existence of the object of the conception cannot be discovered in it by analysis, because the cognition of the existence of the object depends upon the object's being posited and given in itself apart from the conception" (*Kritik*, 392). He adopted the words of Fichte when he says: "From cognition to pass out to an object of cognition—this is impossible; we must, therefore, depart from the reality, otherwise we should remain for ever unable to reach it" (*Reid*, 799). Hence it was that he declared it to be the very cardinal point of philosophy to show that in the act of sensible perception we are conscious not only of ourselves as the perceiving subject, but of an external reality, in relation with our sense, as the object perceived (*Reid*, 747); and hence it was that he concentrated all his powers on the attack of Hume's position—that in perception the mind has never anything present to it but its perceptions, and cannot attain any experience of their connexion with resembling objects (*Hume*, iv. 178).

But, notwithstanding the loud promise of the new departure, Hamilton is eventually forced to

yield the supremacy to Hume. He is compelled to confess that "the primary qualities of things external to our organism we do not perceive, that is, immediately know" (p. 881). He is compelled to confess that "in no part of the organism have we any apprehension, any immediate knowledge, of extension in its true and absolute magnitude" (p. 881). He is compelled, in fine, to resolve our perception of extension into a mere recognition of one organic affection in its outness from another (p. 882)—a recognition which is infinitely variable and confessedly deceptive—an extension which is not extension in its reality, but only an idea of extension. To avoid the inevitable conclusion that in perception the mind has nothing present to it but its perceptions, Hamilton exhausts the resources of his learning, but in vain. In vain he contends that all our senses are modifications of touch. In vain he revives the scholastic doctrine that the soul is all in the whole body, and all in every of its parts. In vain he calls upon us to admit that the organism is at once within and without the mind. In vain he distinguishes between the abstract immaterial ego and the concrete human ego incorporate in matter; between the animated organism and the material things without it; between the contiguous world of touch and the distant universe of vision. The world of vision, the extraorganic world of touch, and the world of the sentient organism are successively surrendered to the idealist and sceptic. Natural realism is foiled at every point. Thrice

has it essayed to grasp reality, but thrice has reality escaped its grasp.

Ter conatus ibi collo dare brachia circum—

Ter frustra comprehensa manus effugit imago.

Hamilton's theory of Perception is not, in fact, the Natural Realism of common sense, but a *Cataleptic Idealism*, similar to that which Cicero attributes to the Stoics (*Acad.* i. 11). The propositions on which Hume challenged contradiction from the philosophers were three. Nothing, he said, can ever be present to the mind but an image or perception; true, we are carried by a natural instinct to suppose an external universe, which exists independently of our perceptions; but when we follow this natural instinct, we suppose the images presented by the senses to be the external objects (*Hume*, iv. 177). Regarding these propositions as the expression of the facts of consciousness, Hume accepted what he calls the whimsical condition of mankind, who must act, and reason, and believe, though they are not able, by their most diligent inquiry, to satisfy themselves concerning the foundation of these operations, or to remove the objections which may be raised against them (iv. 187). In this admixture of speculative scepticism with practical belief, Philosophy refused to acquiesce, and proceeded to deal with the three propositions of Hume as best it could. Rejecting the natural instinct which leads us to believe in the existence of an external world, Berkeley accepted the natural

instinct which leads us to believe that our sensible ideas are external objects, and boldly identified object and idea. Accepting the natural instinct which leads us to believe in the existence of an external world, Reid rejected the natural instinct which identifies the object with the idea, and, in effect, regarded the idea as a representation of the object. Struck with the inconsistency of rejecting one natural instinct and relying on another, Hamilton neither identified the object and the idea with Berkeley, nor made the idea the representative of the object with Reid, but recognizing the co-existence of object and idea, brought the idea into contact with the object, and conceived that the material thing was apprehended—*κατάληπτον*—*manu comprehensum*—in the contact.

But Hamilton seems to have closed his eyes to the difficulties and inconsistencies in which his system is involved. His system postulates the absolute veracity of consciousness in every instance (*Reid*, 745). He holds that 'the immediate or mediate repugnance of any two of its data being established, the presumption in favour of the general veracity of consciousness is abolished, or rather reversed' (p. 746). He appeals to the judgments of consciousness, in fact, as Torquatus appealed to the judgments of the senses—*quibus si semel aliquid falsi pro vero probatum sit, sublatum esse omne iudicium veri et falsi putat* (*De Fin.* i. 7). But he admits that to consciousness 'it appears as if the sense actually apprehended the things out of

itself, and in their proper space' (*Reid*, 748), and nevertheless holds that we reach distant realities, not by perception, but by a subsequent process of inference founded thereon (p. 814). *Ubi igitur illud semel?* Even if it could be established against Hume, that in certain limited relations of contact we apprehend the object in the image, this would not evince the veracity of consciousness in those wider relations of vision where we admittedly mistake the image for the object. Hamilton, then, at the outset is met with the dilemma with which he confronted Brown—if he adhere to his hypothesis, he must renounce his argument; and if he apply his argument, he must renounce his hypothesis (*Reid*, 750). But, apart from this, what is the value of the inference by which he professes to bring distant realities within his reach? He insists that when Locke is asked, how he became aware that the known idea truly represents the unknown reality, he can make no answer (*Reid*, 839). But what answer can Hamilton make when the same interrogatory is administered to himself? He stands confronted by Hume's dilemma, and has nothing to say when the great Academic maintains that 'the opinion of external existence, if rested on natural instinct, is contrary to reason, and, if referred to reason, is contrary to natural instinct, and at the same time carries no rational evidence with it to convince an impartial inquirer.' Hamilton insists that we know from consciousness that the agent which produces the sense of tension, and

pressure, and resistance, is something beyond the limit of the mind and its subservient organs (*Reid*, 859, 883). But the testimony of consciousness to this is not more to be depended on than its testimony to the effect that in vision we apprehend the external object in external space. Hamilton admits that "sensations of light and colours are determined, among other causes, *from within*, by a sanguineous congestion in the capillary vessels of the optic nerve, or by various chemical agents which affect it through the medium of the blood; *from without*, by the application to the same nerve of a mechanical force, as a blow, a compression, a wound, or of an imponderable influence, as electricity or galvanism" (p. 855). Natural Realism therefore supplies no proof, in opposition to Hume, that "the perceptions of the mind must be caused by external objects entirely different from them, though resembling them, if that be possible" (*Hume*, iv. 178). It stands confronted by Berkeley's dilemma, and has no answer to give when the idealist contends that "if there were external bodies, it is impossible we should ever come to know it; and, if there were not, we might have the very same reasons to think there were that we have now" (*Prin.* xx.).

*Quid Democritus, qui tum imagines earumque circuitus in Deorum numero refert, tum illam naturam quae imagines fundat ac mittat, tum scientiam intelligentiamque nostram, nonne in maximo errore versatur?—CIC. de NAT. DEOR.*

THE nature of the Scottish reaction against the philosophy of Kant has been described. The counter-revolution which occurred in Germany remains to be considered.

Kant, as we have seen, regarded it as a scandal to philosophy that it should assume the existence of things external to ourselves as an article of irrational belief (*Kritik*, xl.) He admitted that the external object is not given by any faculty of intuition; and he showed that, if the external object be not originally given, its existence is incapable of proof. But while Kant made these concessions to philosophy, he made concessions more important

still to common sense. The phenomena of sense, he acknowledged, must be produced by some efficient cause, and relying upon what he called the "intellectual conception" of causality, he admitted the existence of a transcendental cause of sensation, which he styled the transcendental object. Our anticipations of the future he saw could never be explained by our recollections of the past; and presuming the existence of the law of physical causation, and others of the same character, in the course of nature, he postulated certain anticipations of these natural laws in thought, and named them the categories of the understanding. All physical science was thus the result of the categories of the understanding applied to the experience of the past; and all experience whatsoever was due to the conjoint action of the transcendental object and our faculties of sense.

The impossibility of building a system of philosophy on mere irrational belief is obvious; for if natural instinct accredits natural realism by asserting the existence of external things, reflection accredits absolute idealism by asserting that what we assume to be external things are nothing but our own ideas. It is the same with regard to demonstration. That the existence of external things cannot be proved by any process of reasoning is admitted by Reid as readily as by Hume, and by Hamilton as readily as by Kant. But the proposition that the external object is not given by any

faculty of intuition has not received as general an acceptance. Hamilton, as we have seen, contended that in certain limited relations the external object is given by the intuition of the senses. But in Germany a still bolder attempt to show that objective reality, even in its highest forms, might be grasped, was made by Schelling, who, soaring high above the region of the senses, revived the doctrine of Plotinus, and maintained that absolute reality might be reached by the vision and the faculty divine, which he denominated intellectual intuition. The possibility of such a philodoxy, as he would have styled it, had been clearly seen by Kant; but here, as everywhere, the common sense of that illustrious man preserved him from illusion. He disclaimed the exercise of the arts of magic. He was a plain man, he said, who knew of no intuition but the vulgar intuition of the senses. He saw nothing in the understanding but a certain faculty of judgment; and the intellectual intuition, with its ecstasies and its absorptions and its unintelligible swoons, he left with the Teutonic Theosopher, the Alexandrine Mystic and the Indian Mouni.

But it was not on the side of intuition that the serious attack was made on the philosophy of Kant; it was on the side of the catégories and the transcendental object. If the existence of objects external to ourselves can neither be perceived nor proved, why, it was asked, should we insist on their existence? Philosophy for centuries had plagued

itself with abortive attempts to determine the relations subsisting between the subject and the object. Kant had shown that the development of the subject was not the mere result of the action of the object; why not assume that the object is the mere creation and projection of the subject? Kant himself had approached this point of view, but with his characteristic caution he had declined to take it as his standpoint. In assuming the existence of the transcendental object, he had taken care to guard himself by saying that it was "an object of which we are quite unable to say whether it can be met with in ourselves or out of us; whether it would be annihilated together with sensibility, or if this were taken away, would continue to exist" (*Kritik*, 206). But what Kant was unable to say, his successors dogmatically said. They professed to be in earnest about idealism. They gave out a series of idealisms—subjective, objective, and absolute—as bewildering and as transient as the northern lights. Fichte, a self-confident and overbearing thinker, commenced the revolution. Schelling—first the follower of Fichte, then the successor of Spinoza, then posing as a new Plotinus, and finally lost in the Aurora or Morning Red of Jacob Boëhmen—astounded the world by his versatility and genius, but was too fitful and erratic to produce any permanent effect upon the world of thought. He was succeeded by a more imperial spirit. Idealism was in the ascendant in Germany, and the crown-

ing victory of German idealism was achieved by Hegel.

The influence exerted by this extraordinary man is one of the most remarkable events in the history of modern speculation. At first he was rapturously hailed as the founder of a new religion. He was regarded as a new Messiah. He was styled a God. Even among the more sober of his admirers the language in which he was described, if less blasphemous than that of Marheinecke, was equally extravagant. He was styled the King of Thought. Förster compared him to Alexander, and said that on his death the throne of philosophy became vacant, and the provinces of thought could only be governed by his satraps. Scherer compared him to Napoleon, and Professor Graham, making the same comparison, exclaims, "they were two lions littered in one year, but the elder and more terrible was Hegel." \*

Nor, if Hegel had accomplished all that he is said to have accomplished, would he have been unworthy of his fame. Professor Graham tells us that the system of Hegel is the most transcendant attempt ever essayed by the aspiring sons of men to solve at once, and by one principle, all the problems of philosophy, and all the sphinx enigmas of existence,

\* *Idealism*: An Essay, Metaphysical and Critical, by William Graham, M.A., of Trinity College, Dublin—a work of great eloquence, and full of

suggestiveness, even to those who do not accept the doctrine which it preaches, or the estimate of Hegel which it forms.

as well as the riddle of the painful earth (*Ideal*. 69). But even this falls short of the pretensions of the great hierophant himself. His logic, he said, was not the mere scientific exposition of the pure notions of the reason; it was the exhibition of truth without her veil—it was the exposition of God in his eternal essence—it was the display of the diamond net in which the universe is held (*Schw.* 323).

Mr. Graham maintains that for years to come it will be the business of philosophy not to refute Hegel, but to try and understand him (p. 41). Confessedly this is not an easy task. Hegel himself has said that to learn his system is to learn to walk upon one's head; and in speaking of his philosophy, shortly before his death, he was fain to admit that of all his disciples one only understood it—and that even *he* did not. Ferrier tells us that, with peaks more lucent than the sun, his intervals are filled with a sea of darkness, unnavigable by the aid of any compass, and overhung by an atmosphere, or rather by a vacuum, which no human intellect can breathe. Stirling, who has devoted a lifetime to the study of his system, and who has written two large octavos on his *Secret*, is no less eloquent on the obscurity of the modern Heraclitus. His system is a Cyclopean edifice—a palace of Oriental dream—a Chinese puzzle—a thing of infinite meddle and make—a map of infinite joinings, of endless seams and sutures, whose opposing edges no cunning of gum, or glue, or paint, can

ever hide. Mr. Wallace, who has translated his *Logic*, has to confess that to the neophyte the atmosphere of Hegelian thought is a vacuum which we cannot breathe, and which is merely tenanted by ghosts.\* In point of fact the most practised and patient of metaphysicians is at fault when he strives to catch the evanescent meanings and interpret the uncouth phraseology of this portentous thinker, while the ordinary man of letters who dips into his works is compelled to quit them in despair, reminded only of the Rosicrucian jargon with which the Adept endeavoured to confound the Antiquary, or the problematical dialogisms, and the concatenations of self-existence with which the Squire smoked Moses in the parlour of the Vicar.

Mr. Graham tells us that the Hegelian system is the final result of philosophy, and that Hegel had the genius to discover and the courage to proclaim that a universal thought is the absolute, and the sole existence (*Ideal*. 19). But if the position that thought is the sole and absolute existence is the last result of philosophy, it was also one of its earliest results. The Greeks, who anticipated everything, anticipated even this. Centuries before the Christian era Parmenides had proclaimed in sounding hexameters that thought and its objects are the

\* *The Logic of Hegel* translated from the *Encyclopaedia of the Philosophical Sciences*, with *Prolegomena* by William Wallace, M.A., Fellow and Tutor of

Merton College, Oxford. This is the most intelligent and the most intelligible account of Hegel's system that the English reader can be referred to.

same. Gorgias had amused the youth of Athens with the paradox which proclaims the identity of Nought and Being. In fact Heraclitus, in metaphors which darkened knowledge, had given forth adumbrations of the whole Hegelian doctrine. When he said that all things are in ceaseless flow, he announced the dogma, according to Hegel himself, that Becoming was the fundamental category of all that is (*Log.* 144). When he proclaimed that strife is the parent of all things, he proclaimed the Hegelian axiom that plurality and contrast were the conditions of knowledge and perception. Nay, when he said that the world is an ever-living fire which is alternately extinguished and rekindled by itself, he merely anticipated the words of Hegel when he said, "the Becoming is as it were a fire, which dies out in itself, when it consumes its material" (p. 146).

Nor was the theory of Absolute Idealism unknown in modern Europe. The marvellous metaphysical genius which had anticipated Kant had also anticipated Hegel. In his youthful Treatise of Human Nature, Hume had unconsciously reproduced the ideas of Parmenides and Heraclitus, and laid the lines of the Hegelian Logic. He said to himself that "as long as we confine our speculations to the *appearances* of objects to our senses, without entering into disquisitions concerning their real nature and operations, we are safe from all difficulties, and can never be embarrassed

by any question" (*Works*, i. 92). Confining his attention to the appearances of objects, he regarded human nature as the capital of science, and boldly marched upon it (i. 8). He declared that all the perceptions of the mind may be divided into impressions and ideas (i. 15). He attempted to classify all the relations, natural and philosophical, by which our ideas are united (i. 30). He stigmatised the ordinary division of the acts of the understanding into three as a vulgar error, and endeavoured to show that judgment and reasoning were nothing but conception (i. 132). He denied that there was any necessity for supposing that every beginning of existence should be attended by a cause (i. 227); and he even professed that our perceptions may exist separately, and have no need of any substance to support their being (i. 299). But the speculations of the youthful sceptic had a wider reach. He examined the idea of *existence* (i. 95). "There is no impression nor idea of any kind, of which we have any consciousness or memory," he says, "that is not conceived as existent; and it is evident that from this consciousness the most perfect idea and assurance of *being* is derived" (*ibid.*). "From hence," he continues, "we may form a dilemma the most clear and conclusive that can be imagined, viz., that, since we never remember any idea or impression without attributing existence to it, the idea of existence must

either be derived from a distinct impression, conjoined with every perception or object of our thought, or must be the very same with the idea of the perception or object" (*ibid.*). That there was no distinct impression from which it could be derived he considered obvious, and accordingly he concluded that "to reflect on anything simply, and to reflect on it as existent, are nothing different from each other"—that "any idea we please to form is the idea of a being, and the idea of a being is any idea we please to form"—in fine, that "the idea of existence is the very same with the idea of what we conceive to be existent" (i. 96). By the same reasoning he came to the conclusion that *external existence* was nothing but a mere idea (i. 97). "Let us fix our attention out of ourselves as much as possible," he said—"let us chase our imagination to the heavens, or to the utmost limits of the universe; we never really advance a step beyond ourselves" (*ibid.*). The consequence of principles such as these was obvious. According to the Treatise, *Space* was nothing but "the manner in which objects exist" (i. 62)—*Body* was nothing but "a collection, formed by the mind, of the ideas of the several distinct sensible qualities of which objects are composed, and which we find to have a constant union with each other" (i. 282)—*Mind* was nothing but "a system of different perceptions, or different existences, which are linked to-

gether by the relation of cause and effect, and mutually produce, destroy, influence, and modify each other" (i. 331).

In broaching this system of absolute idealism, however, Hume was not one of the men of bright fancies who, to use his own simile, are like the angels that Scripture represents as covering their eyes with their wings. When the wing of the angel was removed, no eye could be keener than his in detecting the contradictions and imperfections of his system; no man of common sense could be readier to acknowledge its unsatisfying nature. Philosophy such as this, he said, was mere philosophical melancholy and delirium of which nature is the cure (i. 341); it was a mere dream, on waking from which the philosopher would be the first to join in the laugh against himself (iv. 187). But it was in no such spirit that Fichte reproduced the philosophemes of Hume. The Great Ego, as he was styled by Goethe and by Schiller, is said to have publicly imprecated everlasting damnation on himself if he ever swerved in the smallest degree from any of the doctrines which he had propounded (*Reid*, 796). He submitted the question of external existence to the experiment to which Hume had previously submitted it, and to which, for that matter, it had been previously submitted by Berkeley. Try, he said, the experiment of thinking any given object, and then of thinking the ego, and you will infallibly find that the object thought and the ego thinking

are the same (*Fichte*, 156).\* He rejects, with even more contempt than Hume, "the wonderful assumption that the ego is something different from its own consciousness of itself, and that something, heaven knows what, lying beyond this consciousness, is the foundation of it" (*ibid.* 145). The ego, it is true, was the only substance; but substance was nothing but thought vicissitude in general (*Schwegler*, 267). It was as thought vicissitude in general that the ego comprehended the sum total of reality, the entire compass of existence (*ibid.*). The world of sense in short was nothing but a spontaneous conception of the ego when recoiling from its own limitations (p. 268), and God was nothing but the moral order of the universe (p. 274)—the moral order of our own ideas.

But there is a breach of continuity in the speculations of Fichte, of which Hume at all events was guiltless. The ego from which Fichte's theory of knowledge starts is nothing but the identity of the conscious subject with the object of which it is conscious (*Fichte*, 149). But Fichte goes on to say that the ego referred to is not to be identified with the individual or a person (p. 157). All individual finite spirits, he says, are merely modes of the infinite life, which is God (p. 203). He holds in fine

\* *Fichte*, by Robert Adamson, M. A., Professor of Logic in the Owens College, Victoria University, Manchester—a monogram published in the

Blackwood Series which contains the most intelligible account of Fichte's philosophy which I have met with.

that "the one reality, the one life, the life of consciousness, which is the manifestation of God, breaks itself up into an endless multiplicity of individual forms—forms which in the experience of the finite spirit must present themselves as independent self-existing facts, but which for thought are only modes of the one infinite life (p. 209). Panegoism is thus exchanged for Pantheism, and the absolute idea of Hegel is foreshadowed in the infinite life of which all individual lives are modes.

Logic and Metaphysics, if thought be identical with being, are different aspects of the same thing. But even in the logical aspect of Hegel's system there is little that is absolutely new. The principle that there is no thought without plurality and contrast is as old as Heraclitus, and had been made one of the commonplaces of philosophy by Hobbes. The axiom that the science of opposites is one dates back to the Stagyrte. The famous dogma that all position is negation had been enunciated by Spinoza. The secret of the triple *nisus*, the mystery that reasoning and judgment are only forms of simple apprehension, had been revealed by Hume. The paradox that Pure Being and Pure Nothing are the same is merely a disguise for the platitude that there is no such thing in the world as pure Being, and even that had been propounded by the brilliant Sophist. In declaring that to be untrue means much the same as to be bad (*Log.* 306),

Hegel merely reproduces the theory of Wollaston that morality is conformity with truth; and in attacking the fluxions of Newton and the infinitesimals of Leibnitz he merely reproduces the *Analyst* of Berkeley.

Mr. Wallace tells us that the interpreters of Hegel have contradicted each other as variously as the commentators on the Bible (*Proleg.* xiii.). Nor is this matter of surprise. The metaphysical aspect of his system is constantly changing, and the true method of interpretation is to observe its changes. It is clear that he rejected the transcendental object and the transcendental subject and the transcendental ideality of Kant. The thing-in-itself, he said, whether mind of man or God, was a mere abstraction (*Log.* 77); and time and space, arising as they did in the negative movement of the mind, were nothing but negations. In like manner he repudiated the ego of Fichte and its anstoss. The anstoss, he said, was merely the transcendental object in disguise, and the ego being dependent on it for its impulse was not a free spontaneous force (p. 102). Accordingly, for the ego he substituted the "self-actualising universal," *Thought* (p. 30). This self-actualising universal, in its onward movement through the categories of being, relation, and development, evolved the *Notion* which constitutes the actual thing (*Proleg.* cxxiii.). In this manner external objects corresponded with our conceptions;

but our conceptions, if they were to be regarded as expressions of the truth, should also correspond with the *Idea* (p. 304). Up to this point the idealist was consistent. Thought and existence had been treated as the development of the self-actualising universal—subject and object had been identified—all dualism had been consistently ignored. But here occurs the fissure which has already been remarked in Fichte. Over and above the specific system of ideas which the self-actuating universal calls itself, the idealist admits another system. “The *Absolute*” he says, “is the universal and one idea, which, as discerning, or in the act of judgment, specialises itself to the system of specific ideas, which, after all, are constrained by their nature to come back to the one idea where their truth lies” (p. 305). Here the distinction between subject and object once again emerges, and the transcendental object looms before us in the form of the *Absolute Idea*. And the very nature of phenomena seems to undergo a change. They cease to be purely subjective conceptions, hemmed in by the impenetrable barrier of Fichte (p. 207)—they cease to be subjective intuitions moulded in the forms of Kant—they become objective in their nature. This, in contradistinction to the subjective idealisms of previous philosophy, is *Absolute Idealism*. This is the main point of difference between Kant and Hegel, and the difference is stated by Hegel in the following words:—“The things that

we immediately know about are mere phenomena, not for us only, but in their own nature and without our interference; and these things, finite as they are, are appropriately described when we say that their being is established not on themselves, but on the divine and universal idea" (*Log.* 79).

Before we consider this theory of absolute idealism in its metaphysical aspect, let us examine it in its relation to the categories of the understanding. In holding the categories to be nothing but anticipations of a course of nature which was determined by the operation of a transcendental cause, the critic of the reason found himself met with the question, how is it to be conceived that nature must regulate herself so as to agree with our anticipations? According to Kant, this was a transcendental enigma which he solved on the principle of a pre-established harmony, such as had been conceived by Leibnitz. A similar solution had been given by David Hume. Nature, he said, "has implanted in us an instinct which carries forward the thought in a correspondent course to that which she has established among external objects" (iv. 66)—she has constituted "a kind of pre-established harmony between the course of nature and the succession of our ideas" (iv. 65). This was not satisfactory either to Fichte or to Hegel. In getting rid of the transcendental object they fancied that they had got rid of the transcendental enigma also. The categories, they said, were nothing but the

necessary modes of the action of the self-conscious ego viewed in an objective aspect (*Fichte*, 158). They were "not instruments which the mind *uses*, but elements in a whole, or stages in a complex process, which in its unity the mind *is*" (*Hegel*, 157). In a word, the categories were not the mere anticipations of experience—they were the essential *constituents* of thought.

But it is obvious that this is not a solution, but a mere evasion of the difficulty to be solved. Even if we suppose that nature is nothing but the evolution of a self-actualising universal, we must admit that nature has a course; and even if we suppose that such course is merely subjective and ideal, we must calculate upon its continuance, whether we engage in scientific inquiry or in action. Though we admit that there is no course of nature but the course of thought, the course of thought requires to be anticipated as much as the course of nature. The anticipation that to-morrow I shall have the idea of a sunrise is as much a preconception of the understanding as the anticipation that the sun will rise to-morrow. How is this anticipation to be explained? It cannot be explained by saying that the categories are constituents of thought. Thought may be developed according to the laws of thought, but what guarantee do we possess that the laws of thought will be continued? The acute thinker who first observed that the supposition of the continuance of the laws of nature could not be derived from experience, because

all experimental conclusions presupposed it, observed also that it could not be regarded as matter of demonstration, because it involves no contradiction that the course of things may change. This reasoning, it is evident, is equally just, whether we regard the course of nature as something which exists without us, or as something which exists within. If it be regarded as developed from within we must anticipate our own development. Such an anticipation cannot be regarded as the constituent of that which *ex hypothesi* is not yet constituted—it can only be regarded as a pre-conception, whether we consider it as a mere instinct with Hume, or elevate it to the rank of a category of the understanding with his successor Kant.

The impossibility of evading this conclusion is conspicuous in Mill. Holding, as he did, that we have knowledge of nothing but our sensations, and the laws of their occurrence, Mill adopted an idealism as absolute as that of Hegel. But while he held with Hegel that “the whole variety of the facts of nature, as we know it, is given in the mere existence of sensations, and in the laws or order of their occurrence” (*Exam.* 257), he repudiated the Hegelian conclusion that “the laws of physical nature were deduced by ratiocination from subjective deliverances of the mind” (p. 628). Nay, after many a bewildering statement in the contrary sense, Mill ultimately accepted the view of Hume and Kant, and among the first principles on which his psychological theory

reposed was content to "postulate that the human mind is capable of *expectation*" (p. 225). "The real stumbling-block," he said, "is, perhaps, not in any theory of the fact, but in the fact itself"; and "the true incomprehensibility perhaps is, that something which has ceased, or is not yet in existence, can still be, in a manner, present; that a series of feelings, the infinitely greater part of which is past or future, can be gathered up, as it were, into a single present conception, accompanied by a belief of reality" (p. 248).

Nor was Hegel more successful with respect to the primary aim of his philosophy than with respect to the categories of the understanding. In contrasting the philosophy of Hegel with that of Locke and Kant, Mr. Wallace remarks that the latter philosophers admitted two independent centres in subject and object, and were puzzled, like other philosophers, in their attempt to get from one to the other (*Proleg.* lviii.). Hegel, it is true, by identifying subject and object, seemed to have escaped the puzzle; but it was only seeming. In declaring all objects to be merely the development of a self-actualising universal, he undoubtedly concentrates all objective existence in the subject. The rigorous result of this would be, as stated by Mr. Hodgson in his *Time and Space*, that "the world is produced and developed according to the laws which govern consciousness"—that "we make the world by knowing it" (p. 392). But Hegel shrinks from this rigor-

ous result. He admits the existence of something antecedent to the world—a time when the earth was without form and void, and when darkness was on the bosom of the deep. While professing to have abolished the distinction between object and subject, he leaves the subject confronted by an object as independent of itself as matter. “The living being,” he says, “stands face to face with an inorganic nature, and conducts itself as a power over that nature, and assimilates it to itself” (*Log.* 312). “The nature of the universe,” he elsewhere says, “hidden and shut up as it is at first, has no power which can permanently resist the courageous efforts of the intelligence; it must at last open itself up; it must reveal all its depth and riches to the spirit, and surrender them to be enjoyed by it” (*Hegel*, 195).\* But what is inorganic nature in the development of conscious thought? Here we are met with the most unintelligible of all the unintelligibilities of Hegel. Let us revert to Professor Graham for its exposition. The development of the self-actualising universal has been characterised by progress. The *Phenomenology* is a history of the successive stages through which consciousness has passed. Reason has advanced from the age when man made weapons of flint, to the age in which we live (*Ideal.* 37). But nature must

\* *Hegel*, by Edward Caird, LL.D., Professor of Moral Philosophy, University of Glasgow—another admirable

monogram, published in the Blackwood Series of Philosophical Classics.

have existed in geological periods long before the advent of humanity—and how? As unconscious thought (p. 23). And this explains the origin of the world and man. Unconscious thought may cast up existences as it did in those geological periods, albeit there was no real existence till conscious thought appeared (p. 65). Mr. Graham tells us we must not try to refute Hegel, we must only try to understand him. Let the reader try. “It will be better,” says Hegel, “if we use the term thought at all, to speak of nature as the system of unconscious thought, or, to use Schelling’s expression, a fossilized intelligence” (*Log.* 39). This fossilized intelligence is the new *materia prima*—nay, it is the *primum mobile* as well. Such is the beginning of world in the Genesis of Hegel, and Mr. Graham tells us that it is only an example of his great principle, “that being and non-being are the same” (*Ideal.* 65).

But it is not merely in the inorganic nature which existed in the geological periods before the advent of humanity that the Hegelian encounters the inevitable object. He admits the existence of self-actualising universals other than himself; and it is perfectly clear that if there be a number of self-actualising universals, every self-actualising universal other than himself is an object external to himself, which escapes his apprehension as completely as any material or any transcendental object. The generations of men who preceded him, mere systems of ideas as they are supposed to be,

were not *his* system of ideas. The great battle, amid the thunders of which the Phenomenology was finished, was fought by spirits, to whom his spirit was a stranger. The past was the creation of other minds than his; and the future is an object which his mind may anticipate, but cannot possibly evolve. Above all, the Absolute Idea, in which he supposes himself to live and move and have his being, is a Being far transcending him, a God whose thoughts are not his thoughts, and whose ways are not as his.

Hegel at times gives a great elevation to his language, and a great appearance of orthodoxy to his doctrine, by dilating on the might and majesty of God. Indeed Mr. Graham informs us that "the Hegelian sees God everywhere beneath the world of nature, which is merely his woven veil, and knows him in the high soul of man, which is the manifestation of his spiritual presence" (*Ideal.* 32); and Stirling goes so far as to say that Hegel, in vindicating thought alone as the substantial element in the universe, has extended an immense support to every spiritual influence, and supplied the most powerful bulwark to religion (*Schw.* 443). But the question is not what Hegel believes or says, but what are his principles, and what is the result to which they lead. Let us therefore examine the theology of Hegel.

Mr. Wallace tells us that "the Hegelian system has the all-embracing and encyclopaedic character by which Scholastic thought threw its arms around

heaven and earth"; and that "Hegel's theory is the explication of God, but of God in the actuality and plenitude of the world, and not as a transcendent Being in the solitude of a world beyond" (*Proleg.* xxvi.). Professor Caird adopts the same metaphor, and tells us that "the essential unity of all things with each other and with the mind that knows them is the adamantine circle, within which the strife of opposites is waged, and which their utmost violence of conflict cannot break" (*Hegel*, 141).<sup>\*</sup> But how is the existence of this Absolute Mind arrived at? The Absolute Idea, transcending as it does all finite intelligence, is an object as transcendent as the transcendental object which it endeavours to supplant. Hegel tells us that "when we hear the Idea spoken of we need not imagine something far away beyond this mortal sphere"—"the Idea is rather what is completely present, and it is found in every consciousness, although it may be in an indistinct and stunted form" (*Log.* 306). But, before we can say that the Idea is completely present, its presence must

\* These metaphors may afford the explanation of a seemingly absurd and incongruous doctrine, which is attributed by Cicero to Parmenides, the philosopher who first proclaimed that thought and its object are the same. Nam Parmenides commenticium quidam coronæ simile efficit—*stephanen* appellat—continentem ardore [*quæ*: ardores] lucis orbem, qui cingit coelum,

quem appellat Deum (*De Nat. D.* i. 11). The interpretation of this passage on Hegelian principles is quite consistent with what follows—*Multaque ejusdem monstra, quippe qui bellum, qui discordiam, qui cupiditatem, ceteraque generis ejusdem ad Deum revocat.* All these things, as existing realities, are clearly comprehended in Hegel's Absolute Idea.

be proved, and before we can prove its presence we must prove that it exists. What, then, is Hegel's proof of God's existence? It is the old Cartesian proof. God, he says, "can only be thought as existing"—"his Notion involves Being"—"it is this unity of the Notion and Being that constitutes the only notion of God" (*Log.* 92). But the futility of this argument had been shown by Hume. "In the proposition, *God is*," he said, "or indeed any other which regards existence, the idea of existence is no distinct idea, which we unite with that of the object, and which is capable of forming a compound idea by the union" (i. 132). The futility of the ontological argument had been still more clearly pointed out by Kant. The definition of the idea of existence showed that it was futile (*Kritik*, 367). The word *being* did not really predicate existence, it was merely the copula of logic (p. 368). The analysis of a conception could never establish the existence of its object (p. 392); and we might as well hope to increase our store of knowledge by the aid of mere ideas, as to augment our wealth by the addition of a multitude of noughts (p. 370).

But what is the nature of the God whose existence is supposed to be thus established? The Absolute Idealist informs us. "The Absolute," he says, "is intended, and ought to express God in the style and character of thought" (*Log.* 134). In the style and character of thought he is "the fulness of objectivity, confronted with which our particu-

lar or subjective opinions and desires have no truth and no validity" (p. 289). "God, far from being a Being or Essence, even the highest, is *the* Being or Essence" (p. 180). In fine, "God, who is absolutely infinite, is not something out of, and beside whom, there are other essences"—"all else out of God, if separated from him, possesses no essentiality" whatever (p. 180). But what is the relation between this transcendent essence and our own? Professor Caird tells us that the universe of Hegel is "a universe in which every thought is a truth, and every particle of dust an organisation—a macrocosm made up of microcosms, which is all in every part" (*Hegel*, 179). If we accept this proposition in the literal sense, then God would seem to be merely the sum total of the infinitesimals of finite thought, a mere integration of existence; and war, and discord, and lust, and every evil thought, as Cicero said of Parmenides, must be referred to God. But if God is not the integral of humanity, is man an infinitesimal of God? Every individual being, Hegel tells us, is some one aspect of the Idea; and he tells us that in God we live and move and have our Being. This is the language of Malebranche—the language of Berkeley—the language which was borrowed from Epicharmus by St. Paul. But language so variously applied means anything or nothing. Let us take some intelligible utterance of Hegel. The universal and one idea, he says, specialises itself to a system of specific ideas, which

after all are constrained by their nature to come back to the one idea where their truth lies (*Log.* 305). This would seem to be merely another form of the infinite impersonal life of Fichte. If this be the case, Hegel would seem, like Fichte, to be merely an idealised Spinoza. For what is the doctrine of Spinoza? Spinoza holds that there is one infinite and extended substance of which all finite existences are modes—waves, as it were, of the ocean of being, which rise and swell and subside, but never really are (*Schw.* 173).<sup>\*</sup> If we eliminate the ideas of substance and extension from this conception, we may form some dim adumbration of the Absolute Idea. But if this be the true conception, what is God? According to Stirling himself, nothing but a shadowy universal (*Schw.* 435). And if God be nothing but a shadowy universal, what is man? Let Professor Graham answer. Something as unsubstantial as the cloud, something as evanescent as the foam (*Ideal.* 45).

<sup>\*</sup> Goethe, though he changes the metaphor at the close, would seem to have had this idea of Spinoza's in his mind, when he put the following words into the mouth of the Spirit of the Earth:—

In the floods of life, in the storm of strife,  
On the crest of the wave,  
In the depths of the sea,  
I am birth and grave  
Eternally!  
As I weave my tissues,  
Life glows and issues;  
For the thunderous loom of time is mine,  
Which clothes the world with its life divine!

*Faust*, p. 37.

But even here the difficulties of the Hegelian system do not end. A doctrine which insists upon the co-existence of the Absolute Idea and specific systems of ideas is as dualistic as the doctrine which assumes the mutual co-operation and correspondence of a transcendental object and a transcendental subject. Here the criticism of the Absolute Idealist recoils upon himself. "In every dualistic system," says Hegel, "and especially in that of Kant, the fundamental defect makes itself visible in unifying at one moment what a moment before had been explained to be independent and incapable of unification" (*Log.* 98). But things may be similar in essence without being unified in thought; and notwithstanding any similarity of essence, the question of dualism recurs—How can I know any essence but my own? The Absolute Idea is something supersensible, and Hegel admits that "the rise of thought beyond the world of sense, its passage from the finite to the infinite, the leap into the supersensible which it takes when it snaps asunder the links of the chain of sense—all this transition is thought, and nothing but thought" (*Log.* 87). But if thought leaps into the supersensible, the supersensible into which it leaps is not something out of and beyond itself. Out of and beyond itself not even thought can leap. What thought as thinker thinks, on the principles of Hegel, it creates. If it thinks a Being or Essence which is God, then God himself is its creation. And it is in this sense that Fichte must

be understood when he proclaimed to his astonished audience that in his next lecture he was going to create God. But if this be so, the Hegelian system is absolutely inverted and reversed. The mind of man does not exist in God; on the contrary, God exists only in the mind of man. Pantheism is thus metamorphosed into Panegoism—the ego is declared to be the All—the world, the soul, and God are nothing but imaginations of the ego—and the ego is nothing but a system of shadowy ideas, without any existence in space or time, and without any ground of existence in substance or in cause.

The Absolute Idealism of Hegel, notwithstanding its pretensions, is, in fact, the metaphysical lunacy which Reid attributed to Hume (*Reid*, 127, 209). Nor, after all, can it be more graphically described than in the homely language of the sage of common sense. Like the Treatise of Human Nature the Logic discards spirit and body from the world and leaves impressions and ideas the sole existences in nature (p. 109). Its ideas are as free and independent as the birds of the air, or as the atoms of Epicurus when they pursued their journey through the vast inane (*ibid.*). They are set adrift in the world without connexion or support (*ibid.*). “But why,” said Reid, “should we seek to compare them with anything, since there is nothing in nature but themselves? They make the whole furniture of the universe; starting into existence, or out of it, without any cause; combining into parcels, which

the vulgar call minds, and succeeding one another by fixed laws, without time, place, or author of those laws" (*ibid.*).

How then have the promises of Hegel been fulfilled? Has he exhibited the diamond net in which the universe is held? Has he given an exposition of God in his eternal essence? Has he exhibited truth without her veil? He has done none of these things. He professes to have displayed the diamond net in which the universe is held; but he has only shown that the universe is a mere evanescence with no diamond net to hold it. He professes to have given an exposition of God in his eternal essence; but he has only shown that God in his eternal essence is a shadowy universal. He professes to have exhibited the form of truth without a veil; but like the Grecian painter, it is only the veil itself that he has painted. And what of the sphinx enigmas of existence, and the problem of the painful earth? Hegel solves the enigma by declaring there is no enigma to be solved. He finds no difficulty in conceiving that things may subsist without a substance and originate without a cause. He assumes the existence of our sensations without inquiry as to where they come from, and how it is that they arise. He assumes their co-existences and their successions and their laws without asking how the co-existences and successions are determined, by what power those laws have been imposed. The logic of Hegel gives no answer to the questions which can-

not be evaded by the philosopher any more than they can be evaded by the common man. "Where am I, or what? From what causes do I derive my existence, and to what condition shall I return? Whose favours shall I court, and whose anger must I dread?" Hume asked himself these questions, and professed himself to be confounded (i. 340). Kant asked them, and left reason trembling on the verge of the abyss of necessity, which he regarded as the ultimate support of all existing things (p. 376). These questions the philosophy of Hegel ignores; it ignores the very craving of intelligence by which they are suggested. He is content to regard God as a shadowy universal with no existence but a shadow's; he is content to regard the universe as only another name for that shadowy universal; and oscillating between Pantheism on the one hand and Panegoism on the other, he is driven to regard man as either a mere shifting shadow of a shade, or an unessential essence which constitutes the universe of things.

AN IDEAL OF SYSTEMS:

OR

THE NEW KRITIK.

# AN IDEAL OF SYSTEMS:

OR

## THE NEW KRITIK.

*Sed jam, ut omni me invidia liberem, ponam in medio sententias philosophorum; quo quidem loco convocandi omnes videntur, qui quae sit earum vera judicent.*—DE NAT. DEOR.

THE advent of Hegel, as we have seen, was regarded as the advent of a new Messiah; and in the hour of his triumph all Germany hailed him with hosannas. But the hosannas were followed by a crucifixion. A reaction set in against the absolute philosophy. Unbelievers began to ridicule its empty abstractions, its shadowy universals, its artificial trichotomies, its affectation of omniscience, and its wearisome iteration of barbaric and unintelligible terms.\* Heine described the Hegelian system as a harlequinade of thought; and Schopenhauer derided its author as a philosophical acrobat,

\* The following details are derived from a very interesting work—HEGEL *Philosophie Allemande Moderne depuis Kant jusqu'à nos jours.* Par A. Foucher et SCHOPENHAUER, *Études sur la* de Careil. Paris, 1862.

who had the misfortune to have lost his body. Schopenhauer went still further—further perhaps than he was justified in going. He denounced Fichte, Schelling, and Hegel as three sophists who made a trade of philosophy, and were the intellectual mercenaries of the state—ready to abandon pantheism for pietism if adequately paid, and, like Bottom the weaver, equally prepared to roar as the lion or to whisper as the sucking dove.

Schopenhauer professed to have supplied an element which he said was wanting in Hegel's theory of the evolution and self-development of *thought*. "My great discovery," he said, "is a Thebes with a hundred gates; it is that, at the base of all things, there is a *force* which is one and identical, always equal and eternally the same; and that this force, which slumbers in the plant, which awakes in the animal, and which becomes conscious of itself in man, is *will*."\* But Stirling is right (*Schw.* 446). Although Schopenhauer must take a high rank among German philosophers, it is clear that German philosophy is closed with Hegel. The shadowy universal, with no existence in space or time and with

\* Goethe, who was a friend of Schopenhauer, probably had this theory in view when he makes Faust hesitate as to how he should translate the *λόγος* of the famous passage of St. John :—

Is it mere *thought* evolves all nature's course?  
 Surely in the beginning there was *force* !  
 Still as the word is traced beneath my hand,  
 A something warns me not to let it stand.  
 The Spirit aids me—all is now exact—  
 I write, In the beginning was the *act* !—*Faust*, p. 73.

no ground of existence in substance or in cause, was the last word of idealism. Even the power of absurdity, which Hobbes regards as the privilege of reason, could go no further.

The history of philosophy from Berkeley to Hegel would seem to justify the positive philosopher in his prophecy that the educated intellects of the future would abandon all metaphysical speculation, and devote themselves exclusively to the study of the phenomena of nature and their laws. But as Schopenhauer remarks—and the remark had previously been made by Kant—there is a metaphysical instinct in human nature which is as ineradicable as any of its other instincts. The energetic intellect of youth, when it feels the first stirrings of intellectual life, conceives everything to be open to its efforts, and with unconscious audacity looks the mystery of existence in the face and fancies it can solve it. It may be that this is a mere beating of the air, but it is the beating of the air which develops the muscles of the athlete. Nor is this the only factor in the case. In every free state—and this is the most obvious indication of its freedom—there will ever be men who, by the bias of their genius, will devote themselves to philosophy, as others devote themselves to poetry and art; and as poetry and art are never exhausted, so philosophy will everlastingly assume new forms. The object which the philosopher sets before him may be as far beyond the reach of human knowledge

as the grand arcanum or the great elixir. But the spirit of metaphysics never dies. Its destruction is as illusory as that of the visionary maid which Dryden's Theodore beheld when "more than a mile immersed within the wood." The hounds may fasten on her side and the knight may plunge his sword into her back; but an irrevocable sentence has been past. The pursuit must for ever be continued, and the phantom is no sooner slain than it revives—

Renewed to life, that she might daily die,  
We daily doomed to follow, she to fly.

But is philosophy, after all, the visionary pursuit that is imagined? As Hume has remarked, it is no inconsiderable part of science to know the different operations of the mind, to separate them from each other, to classify them under their appropriate heads, and to remove all the seeming disorder in which they are involved, when made the subject of reflection (iv. 12). But there is an element of science, even in the books of metaphysics, which the sceptic wished to burn. In the attempt to solve the metaphysical problem of the world a number of hypotheses have been framed by philosophers, and though none of these hypotheses can claim to rank as science, yet in their totality they possess a scientific value. In themselves they may be the mere play of philosophic imagination, the romance of reason. But reason, confronted with the great mystery of existence, cannot choose but make its guesses

at the riddle. Every philosophy is such a guess; and a complete system of philosophies will constitute the sum total of the guesses which reason is competent to make. Such a system, even as a matter of curiosity, would be interesting, and, as a fact expressive of the limitation of the powers of reason, would come within the strict domain of science. Nor is it impossible to imagine such a system. In every department of mental philosophy a conspectus of the various theories which have been invented may be made. The theories as to the origin of knowledge, or as to the nature of universals, or as to the true character of the process of induction, may be contabulated so as to see where they diverge, how far they differ, and in what respect they are expressions of the truth. Such a synopsis of systems would not only facilitate study, but would go far to remove the opprobrium of philosophy—the fatal differences of opinion which seem to exist among its masters. For truth is a polygon, and not a point; and apparent differences of opinion are caused by the different sides of the polygon on which the attention of philosophers is fixed. It is thus that a Kritik of Systems is required to supplement the Kritik of Reason. Let us see whether on the subject of the great cosmological problem the outlines of such a Kritik can be traced.

“It seems evident,” says Hume, “that men are carried by a natural instinct or prepossession to

repose faith in their senses, and that without any reasoning, or even almost before the use of reason, we always suppose an external universe which depends not on our perception, but would exist though we and every sensible creature were absent or annihilated." While we are under the influence of this natural instinct, not only do we suppose an external universe, which depends not on our perception, but we suppose that we immediately perceive it. It appears to us as if sense actually apprehended things out of itself and in their proper space. We make no distinction between the object existing and the object known. We presume not only that the world exists, but that we know it as existing. We presume that we know it not as a mere cause, but as an object. This is the conclusion to which we are led by the instinct of our nature; and this instinctive determination of the human race is *Natural Realism* in its only intelligible sense.

"But," as Hume continues, "this universal and primary opinion of all men is soon destroyed by the slightest philosophy, which teaches us that nothing can ever be present to the mind but the image or perception, and that the senses are only the inlets through which these images are conveyed, without being able to produce any immediate intercourse between the mind and the object." And in this, as a statement of the fact, the philosopher is right. The blue of the ocean and the sky, the

green of the forest and the field, all the variegated colours of creation, are admitted to be mere sensations. Everything which seems presented from without by vision is admittedly projected from within. What we take to be reality turns out to be a mere conception of the mind. It is the idea of which we are conscious, and not the actual thing. But with the instinct of reality still strong upon us, we are unable to accept the doctrine of a pure, unqualified idealism, which admits the existence of nothing but the mere idea. Convinced that in the perception of the distant we are only conscious of an idea, we nevertheless regard the idea within as representative of the thing without. The theory of Representative Perception thus emerges. We suppose the existence of a reality which our idea represents, and *Hypothetical Realism*, to employ the phrase of Sir William Hamilton, is the first conclusion which we adopt when we abandon common sense and instinct for philosophy and reason.

But how can we know that our ideas are representative of objects which are thus assumed to be unknown? The question did not escape the Atomists of old, and their answer is given by the poet who beautified the sect which was otherwise inferior to the rest. We are told by Lucretius that, stripped from the surface of external things, light films are incessantly emitted, which, borne upon the air, are received by the various appliances of

sense, and are the *Sensible Eidola*, which represent the realities from which they come.

The slender form and effigy of things,  
By things emitted, from their surface springs ;  
Membranes, or films, they bear, whate'er their name,  
The image of the thing from whence they came,  
The species similar—the form the same.

Such was the theory which Democritus bequeathed to Epicurus—such was the theory which Reid attributed to all philosophers from Plato down to Hume. And undoubtedly there is an element of truth in this, the earliest of the theories of perception. Unless the rays of light impinge upon the retina of the eye, unless the tympanum of the ear be struck by the vibrations of the air, unless there be an effluvium of the particles of odour soliciting the membrane of the nose, we neither see, nor hear, nor smell. But a material antecedent is not of necessity a material efflux ; and a material efflux is not of necessity a material film ; and the presence of a material film is one thing, and the sensation of which it is the antecedent is another. How, then, is the mental fact, the fact of consciousness, to be explained ? This was a question to which the theory of Democritus, as far as we are acquainted with it, gave no answer. An answer was essayed by Aristotle. Perception, the Stagyrte said, is the reception not of a material film, but of an immaterial form. The mind receives the form of things perceived without the matter, just as

wax, when impressed by a seal, receives nothing but the mere impression. What we are conscious of is not a sensible eidolon, which is a modification of matter, but a *Sensible Idea*, which is a modification of the mind itself. Here, too, there is an element of plausibility or truth. As far as appears, our organs of sense stand in relation to certain specific qualities of body, and each sensation receives its development, its form, from the operation of the quality to which it corresponds (*Reid*, 827). But the rationale of the doctrine escaped the apprehension of the men who proclaimed themselves the followers of the great master. The form with which he conceived the mind to be impressed they seem to have regarded as a matterless efflux from matter. A system of entities, distinct from matter and from mind, was thus devised; and the material films of Democritus were superseded by the *Intentional Species* of the schoolmen. A simpler doctrine, one perhaps identical with that of Aristotle, was afterwards embraced. The sensible idea was regarded as a mere act of sense; the act of sense was conceived to be determined by the secret powers of matter; and thus, with a minimum admixture of hypothesis, was developed the theory of *Physical Influence or Influx*.

A film emitted, a form impressed, a fact of consciousness determined, such are the three aspects under which our ideas of sensation may be regarded as the representatives of material things. But the difficulties of the case were not exhausted.

A deeper and more serious question arose. Matter and mind, it was said, are different in their nature; they are separated by the whole diameter of being. Not only must philosophy explain how the mind can perceive matter at a distance—it must explain how mind can perceive matter in contact, or at all. The hypothesis of a *Plastic Medium*—a medium which was neither mind nor matter, but which had affinities with each—was excogitated in order to bring the two discordant elements into relation. But the Plastic Medium was a mere hypothesis, with nothing in experience to suggest it; and the interposition of a medium between mind and matter scarcely disguised and did not solve the problem. To solve the problem the Alexandrine philosophers devised the theory of *Gnostic Reasons*. They supposed certain forms and representatives of things which, prior to the act of perception, have a latent existence in the soul;\* and they held that on the occasion of the impression made on the external organ by the object, the mind, being roused to action, mingles the image from without with the

\* Tum mentis vigor excitus,  
Quas intus species tenet  
Ad motus similes vocans,  
Notis applicat exteris,  
Introrsumque reconditis  
Formis miscet imagines.

It is strange that Hamilton, in citing these verses of Boethius, should have

failed to observe the approximation of the theory of Gnostic Reasons to the Kantian doctrine of the Forms of Sense, although he observed its approximation to the hypotheses of Descartes and Leibnitz (*Reid*, 263). The Alexandrine theory was adopted by Kant's immediate predecessor, Wolff (*Log.* i. 6).

form within, and elicits into consciousness the representation through which the reality is known (*Reid*, 263). In thus mingling the image with the form, the theory of gnostic reasons, it is obvious, approximates to the transcendental ideality of Kant. But its defects are obvious. It assumes the existence of the external world, for our knowledge of which it professes to account; and while admitting the action of matter on the living body and the stimulated mind, it in effect merely gives a statement of the difficulty which it was invented to explain.

It was at this point the discussion of the question was resumed in modern times. The material world, it was conceded, was not given as an *object*; the question was, could matter be regarded as a *cause*. Matter, it was said, is conceived as passive and inert; how, then, can it be conceived as cause? It is conceived as essentially unthinking; how, then, can it be conceived as the cause of thought? Restricting the conception of causation to that of efficiency, and assuming that the conceptions of the human mind are the measure of the possibilities of things, philosophy once more embarked on the sea of speculation. Though matter be conceived as in its own nature incapable of thinking or producing thought, might it not be regarded as invested by Omnipotence with powers which it did not of itself possess? This was the theory of Locke. We may conceive that God, if he pleases, can superadd to

matter a faculty of thinking; and though motion, according to the utmost stretch of our ideas, can produce nothing but motion, we may still allow it to produce sensation, if we attribute it wholly to the good pleasure of our Maker (*Essay* iv. iii. 6). Philosophy thus effected an alliance with Theology, and the first fruits of the connexion was this theory of the *Hyperphysical Influence of Matter*. But this conception, it is plain, could scarcely stand the test of logic. If motion can produce nothing but motion, if the production of sensation is resolved into the good pleasure of our Maker, it is God and not matter that is the cause of thought. A new hypothesis was therefore started. God, said the Cartesian, by the incessant action of his omnipotence, produces all the changes in material things, but he does not operate on matter so as to enable it to manifest itself to mind; he operates on mind so as to enable it to take cognizance of matter. On the occasion of the presence of the material object, God, as the efficient cause of thought, determines the mind to the formation of a representative idea. Such was the theory of *Occasional Causes* or *Divine Assistance*. But this theory also was open to attack. According to its opponents it postulated a perpetual miracle. It condemned the Creator to create for ever. In the vigorous phrase of Aristotle, it compelled the Deity to put his hand to everything. It degraded the Demiurgus to a drudge. In opposition to the theory of the inces-

sant agency of God, it was maintained that the series of causes and effects spontaneously evolves itself as a consequence of the original constitution of the world. The music of the spheres was not that of an organ on which the musician strikes every note, nor that of a cylinder which the maker was himself obliged to turn: it was that of a mechanism which the great artist had cunningly contrived, and which, when once set going, never ceased its chime. There was a *Pre-established Harmony* between mind and matter. According to Leibnitz the mind of man was a monad, a unit of substance, endowed with a representative power, and the various representations which it evolves were pre-adjusted so as to correspond with the pre-adjusted evolution of material monads. The soul and the world were clocks with independent springs, and set to correspond. But this theory, like its predecessors, failed to satisfy the exigencies of speculative thought. It introduced the principle of mechanism into incorporeal things. It postulated what it did not prove, the existence of the world. It postulated what it did not prove, the existence of a God. It did not even solve the difficulty which it was framed to solve. If, as the Leibnitzian averred, everything goes on in mind as if there were no matter, and everything goes on in matter as if there were no mind, the chasm between mind and matter, it is evident, remains unbridged, and philosophy stands helpless on its verge. To bridge the chasm, recourse was had to theology once more.

Philosophy accepted from theology not merely the agency of a God, but the existence of a revelation, to enable it to solve its problem. On the authority of revelation it assumed the existence of an external world, and then it had recourse to reason to explain the knowledge of the existence so assumed. "In the beginning God created the heavens and the earth"—and therefore, said Malebranche, the heavens and the earth have a material existence. Of that material existence we can have no knowledge, for mind cannot take cognisance of matter. But God takes cognisance of the world, the existence of which he has revealed, and he can communicate that cognisance to us. In him we live and move and have our being. Our sensations are the production of his power; our perceptions are a participation of his knowledge. What he sees we see, what he thinks we think—we are parts of him. We are partakers of his heavenly vision, and the world of sense is the *Vision of the Universe in God*.

Matter operated on by God so as to reveal itself to mind; mind operated on by God so as to take cognisance of matter; matter and mind each operated on by God so that their modifications should correspond; mind admitted by God to a participation of his knowledge of material things—such are the four great forms of *Theological Realism*—a realism which recognises the existence of a world of matter, but professes itself unable to explain our knowledge

of that existence without the intervention of a God. From such a realism the transition to a pure *Theological Idealism* was as inevitable as it was obvious. If, as Malebranche said, God produces our sensations—why not allow him to produce our perceptions also? If all that the mind is conscious of is a series of conceptions; if that series of conceptions in the mind can never be produced by matter; if the Deity must be invoked to account for the appearances of sense—why suppose the existence of material things? Their existence could not possibly be proved. True, there must be some cause of the continual succession of ideas which we experience; but that cause must be an incorporeal active substance other than ourselves (*Prin.* xxvi.). The existence of a Spirit infinitely wise and powerful and good is sufficient to explain all the appearances of nature (§ lxxii.). But if we come to the conclusion that there is “a mind which affects us every moment with all the sensible impressions we perceive” (*Dial.* ii.), the consequence is clear. The soul does not exist in the world; the world, on the contrary, exists only in the soul. Space cannot exist without the mind, and its idea is a mere abstraction (*Prin.* cxvi.); even time itself has no existence abstracted from the succession of our thoughts (§ xcvi.).

Berkeley fondly imagined that with materialism and atheism he had also banished *Scepticism* from the world. But his idealism in reality evoked the sceptic. This was shown by Hume. The arguments

of Berkeley, he said, admit of no answer, and produce no conviction (iv. 181). Nature, by an absolute and uncontrollable necessity, has determined us to judge as well as to breathe and feel (i. 240), and if we listen to the dictates of nature, the existence of body must be taken for granted in all our reasonings (i. 245). As an agent, he said, I am quite satisfied with this; but as a philosopher I want to learn the ground of my belief (iv. 47). The ground of the belief, according to Berkeley, was a mere illusion arising from our consciousness that our sensations are imprinted from without. The tenet in question involved a contradiction. Strictly speaking, there was and could be no belief in the existence of objects independent of the mind (*Prin.* lvi.). This, it is evident, was a new departure. In recognising the existence of matter, preceding philosophers had deferred to the authority of common sense; in denying the existence of matter, Berkeley committed common sense and philosophy to an internecine conflict. If we wish to know the issue of the conflict, we have only to pursue the history of idealism from its rise with Berkeley to its culminating point in Hegel.

Hume prepared the way for Kant. His unknown cause (iv. 178) was in reality the transcendental object. His principle, that nothing can be inferred from experience which every inference from experience presupposes (iv. 46) was the principle of the categories of the understanding. Above all, his

position that the ideas of space and time are not separate and distinct ideas, but merely those of the manner in which objects exist (i. 62), was, in effect, a declaration that space and time were transcendently ideal. The transition from positions such as these to the *Transcendental Idealism* of Kant was but a step. If space and time be merely ideas of the manner in which sensible appearances exist, why should we postulate their absolute existence? If space and time are presupposed in all sensible experience, why should we not regard them as the forms of sense? The things which we intuit in space and time are nothing but phenomena, and phenomena are nothing but representations moulded in the forms of sense, which have no self-subsistent existence apart from human thought (*Kritik*, 307). It is true we must suppose the existence of some transcendental object as an originating cause which stimulates our sensibility; but the nature of that object is essentially unknown. We know not whether it exists within ourselves or whether it is to be found without. Such was the reasoning of Kant. The Deity of Berkeley was superseded by a *nescio quid*; his abstractions were declared to be the constituent forms of sense; and, in spite of his consciousness that our sensations are imprinted from without, it was held that the ideal world, in part at least, was originated from within.

The *Subjective Idealism* of Fichte was the outcome of the *Transcendental Idealism* of Kant. Where was

the necessity for assuming a transcendental object? If a cause for the world of sense must be assumed, why should we seek the cause beyond ourselves? The activity of the ego was manifest in consciousness. In its action it evolved all the conceptions with which philosophy was concerned.: why should we deem it insufficient to account for the appearances of sense? In its onward movement, it is true, it seemed to encounter an insurmountable obstacle which drove it back upon itself. But this obstacle was merely an *anstoss* which, like the sense of incubus, had its origin within. It was this which induced the ego to form the notion of a thing without; it was thus that it formed the conception of objects occupying space. But all this was nothing but conception. The objects which appear to be external were the various breakings of the action of the ego against an incomprehensible obstacle (*Schw.* 268)—they were the mere spray of the billow when recoiling from its bound.

The subjective idealism of Fichte, after its brief hour of triumph, gave way to the *Absolute Idealism* of his rival. The incomprehensible obstacle of Fichte, it was said, was merely the transcendental object in disguise (*Log.* 102); his idealism left us hemmed in by an impenetrable barrier, and confined us to our subjective conceptions for a world (p. 207). The transcendental object, whatever form it might assume, was nothing but a mere abstraction (p. 77). The things which we immediately know were phe-

nomena, it is true; but phenomena were neither subjective intuitions moulded in our forms of sense, nor subjective conceptions formed by our understanding in its recoil from nothing; they were simple appearances existing in their own nature, and without our interference (p. 79). Genuine idealism was in fact the *Transcendental Realism* which the critic of the reason had rejected (*Kritik*, 307). Phenomena were things subsisting in themselves (*ibid.*). There was no essence behind or beyond the appearance; existence was nothing but appearance, and appearance was all that essentially exists (*Log.* 206). Appearances supplied the content of the absolute idea (p. 307); of this absolute idea every individual was an aspect (p. 305); and in these aspects "God, who is the essence, lends existence to the passing stages of his own show in himself," and is "the infinite kindness which lets its own show freely issue into immediacy, and graciously allows it the joy of being" (p. 206).\*

But even Fichte and Hegel recoiled from the rigorous results of their respective systems. Their common purpose was to solve the problem of objec-

\* Goethe, who was the friend and benefactor of Hegel, would seem to have had some such idea as this in view when writing the closing words of the *Prologue in Heaven* :—

But ye, true Sons of God, surrender  
Your spirits to the rich and living Splendor!  
The teeming Whole which ever works and lives  
Bind you together with its blessed linking!  
And all the shifting shows its essence gives  
Substantiate by unremitted thinking!—*Faust*, p. 24.

tive knowledge by abolishing the difference between the subject and the object. Rejecting the dogma that the non-ego produces the ego, Fichte propounded the counter dogma that the ego produces the non-ego, and regarded the object as a mere conception of the subject. Rejecting the dogma that the object is a mere conception of the subject, Hegel propounded the dogma that there is no objectivity apart from universal thought, and regarded the subject as an aspect of the object. But objectivity remained. The subjective idealist recognised an infinite life, of which every individual is a mode; the absolute idealist recognised an absolute idea, of which every individual is a phase. Both of them admitted that personality is inconceivable, unless we assume the existence of a multiplicity of persons; and each of them, accordingly, assumed the existence of a system of egos coexistent with himself (*Fichte*, 182, 202). But on the slope of speculation the descent of down-lapsing thought is not to be arrested. To the reflecting ego a system of egos other than itself is as much an external object as an external world of matter. If consciousness is unable to transcend itself, then the infinite life and the absolute idea are as far beyond its reach as the most transcendental, the most transcendent, object. It is in vain to resolve the elements of the universe into thought, and to exclaim, *Alles ist Ich*; that is a position which cannot be consistently maintained unless we are prepared to

hold that Ich ist Alles. *Egoistic Idealism*, therefore, with its world of subjective conceptions, is the bourne for which all idealism is ultimately bound. This is shown by the philosophy of Fichte in its earlier form. There the Deity was nothing but the moral order of the universe (*Schw.* 274); the universe was merely the sum total of the conceptions of the ego (p. 267); and the ego itself was merely thought vicissitude in general (*ibid.*). The ego was thus converted into the egomet; the egomet declared itself to be the All; and *Panegoism* was the last expression of the "philosophical delirium" of Hume.

Yet not the last. For what is *Panegoism* itself when the ego is destitute of substance? On the acknowledgment of Fichte it is merely *Nihilism* in disguise. "The sum of all", he says, "is this. There is absolutely nothing permanent either without me or within me, but only an unceasing change. I know absolutely nothing of any existence, not even of my own. I myself know nothing, and am nothing. Images there are; they constitute all that apparently exists, and what they know of themselves is after the manner of images; images that pass and vanish without there being aught to witness their transition—that consist, in fact, of the images of images without significance and without an aim. I myself am one of these images; nay, I am not even thus much, but only a confused image of images. All reality is converted into a marvel-

lous dream, without a life to dream of, and without a mind to dream—into a dream made up only of a dream of itself. Perception is a dream; thought—the source of all the existence, and all the reality which I imagine to myself of my existence, of my power, of my destination—is the dream of that dream”. That is the last word which idealism has to utter. That, according to one of the greatest of the idealists, is the sum of all.

Such is the natural and almost the historical development of the various theories which have been propounded to explain the phenomena of sense. Like the unquiet spirit in the gospel, for two thousand years and more, the spirit of speculation has wandered to and fro through the wilderness of thought, seeking evermore for rest and finding none. Impelled by an unreflecting instinct, we first imagine that we grasp the thing; instructed by awakened reason, we are fain to confess that what we are conscious of is nothing but the idea. With the instinct of reality still strong upon us, we are prompted to regard our ideas as representatives of things, and forthwith atoms, forms, and films are invented as intermediaries between the reality without and the conception of the reality within. Baffled in the endeavour to conceive the nature of the relation between mind and matter, in our inability to explain the inexplicable, we invoke the Deity, and speculation enters the domain of hyperphysical influences, miraculous causes, ima-

inary harmonies, and theosophic visions. The  
a/ Deity having ~~being~~ invoked to account for our knowledge of the world of matter, the existence of the world of matter is ignored as unnecessary to the operation of the Deity, and our ideas of sense are conceived to be excited in our minds by the unassisted agency of God. But as the world was superseded by God, so God in his turn is superseded by the soul. The mind, which first rushed into materialism, then burst into the region of theology, falls back exhausted on itself. It first declares space and time to be mere forms of sense; it next denies the existence of all external causes; and, finally, it ignores all substance. It resolves the universe into unsubstantial thought, and hails this unsubstantial entity which trembles on the verge of non-existence as the All.

What, then, is the impression left upon the mind by the contemplation of so many shadowy and shifting systems? In these lofty solitudes of thought we see nothing but the mists which boil around the glaciers, and, like Manfred on the summit of the Jungfrau, we are giddy. But it is not in vain we have reached these silent heights. It is something to have climbed the mountain; it is something to have seen the mists. We have tried our powers; we have satisfied our curiosity; we are content. But is this the only benefit that those high speculations are calculated to confer? By no means.

They have shown us our ignorance, it is true, but in ascertaining our ignorance we have increased our knowledge. We know what we may aspire to know, and we know what cannot possibly be known. To use the phrase of Locke, we have learned the length of our tether, and we are satisfied to sit down in quiet ignorance of the things which lie beyond the reach of our faculties of knowledge. And our ignorance as to these subjects is quiet because it is complete. We have learned to regard with indifference any new demonstrations of the old indemonstrable dogmas. We know that it is as impossible to prove thought to be a function of matter as it is to prove matter to be a phantasy of thought. We know that the materialist cannot prove the existence of the molecules which he would substitute for ideas—nay, that he cannot prove the very existence of that matter by means of which he would fain supersede the necessity of recognising any spiritual existence either within us or beyond us. But what is this absence of knowledge of which the agnostic so bitterly complains? In reality it is of no significance whatever. We are so constituted, that upon those all-important subjects which we cannot know we are compelled to think; and in thinking on them there are things which we cannot but believe; and even in the absence of grounds for unwavering belief there are probabilities on which, as reasonable men, we may well be satis-

fied to act.\* For probability is the guide of life. In enterprises of the highest moment we are constantly compelled to take action in the midst of uncertainty and doubt. The great practical intellects which have swayed the minds of men and shaped the destinies of nations have been the most conspicuous for the promptitude with which they calculated probabilities and took their chance. And in the same spirit they were ready to take their chance in higher things. Bacon would rather believe all the fables of the Legend, the Talmud, and the Koran, than that this universal frame was without a mind; and Napoleon, looking up into the star-lit heavens, appealed to the principle of final causes as confidently as Butler or as Paley.

The fact is, we hold the possessions of our higher life by the same tenure as that on which we hold our possessions in the world of sense. And it is here that philosophy, even in its negative or agnostic side, has rendered a service to religion. It has shown that we can live upon a world the existence of which we cannot prove. It has shown that we can safely calculate on the continuance of a course of nature in the future which we do not know. It has shown that we can associate and act with

\* Tum Catulus, Egone? inquit—ad patris revolvor sententiam, quam quidem ille Carneadeam esse dicebat, ut percipi nihil putem posse, assensurum autem non percepto (*Acad.* iv. 48). Is quoque qui a vobis sapiens inducitur,

multa sequitur probabilia non comprehensa, neque percepta, neque assensa, sed similia veri, quae nisi probet omnis vita tollatur (*Ibid.* 31). This is alike the language of Butler and of Hume.

a multitude of fellow-creatures whose existence is as incapable of demonstration as that of the Deity himself. It has shown, in fine, that in the most ordinary events of life, as in the deepest mysteries of religion, we live by faith and not by sight. For the whole universe is concealed from us by the veil of our ideas. What is it that exists beyond the veil? That is a question which we can neither answer nor evade. The mind of man is haunted by the supposition of something, he knows not what, which is beyond him. It is in this sense of the unknown that all philosophy and all religion have their source. But the highest intelligence is as helpless as the lowest when it tries to grasp it. The mystery of existence is as inscrutable to the modern philosopher as it was to Plato; and it was as inscrutable to Plato as it was to the ignorant Egyptian who forty centuries ago bowed before the Veiled Statue of Isis, and worshipped the symbol of existence as the Unknown God.

### NOTE A.

#### LOCKE : ON THE ORIGIN OF IDEAS.

LOCKE, as his philosophy for two hundred years has been understood, is the father of modern empiricism, and as such the source to which we must trace the sensualism of Condillac, the selfishness of Helvetius, and the atheism of La Mettrie and Mirabaud. In opposition to this view, I published the *Intellectualism of Locke*, in which I endeavoured to show that Locke, when properly understood, is to be ranked with Reid and Kant, and not with Helvetius and Condillac. As that work has long been out of print and may never be republished, I propose in this note to recall the reasons which conducted me to that conclusion.

The purpose of Locke, as he himself expresses it, was "to inquire into the original, certainty, and extent of human knowledge, together with the grounds of belief, opinion, and assent" (*Essay* i. i. 2). As the basis of his inquiry he assumes that no object is presented to the understanding but *ideas*, and, accordingly, he makes the word idea "stand for whatsoever is the object of the understanding when a man thinks" (i. i. 8). *Knowledge* he subsequently defines to be "the perception of the connexion and agreement, or disagreement and repugnancy, of any of our ideas" (iv. i. 2). In order to ascertain the origin of knowledge, therefore, it is necessary to ascertain the origin of ideas, and, accordingly, Locke's first inquiry is, how ideas come into the mind (i. i. 8).

The controversy raised by Reid and continued by Hamilton

as to the nature of Locke's *ideas* may happily be considered obsolete. No one now-a-days contends with Reid that Locke's idea was a *tertium quid*, existing in the mind like a wafer in a box; everybody believes it to be, what Locke persistently asserts it to be, an act of perception (II. x. 2)—a modification of thinking (II. xix. 1)—a mere act or affection of the mind (II. xxvii. 25). How, then, do these actual perceptions or modifications of thinking first arise?

The first book of the Essay contains a negative answer to this question—we have none that are *innate*. The criticism of Leibnitz on this doctrine of Locke is well known, and it supplies a key to all the misunderstandings and misrepresentations which have followed. "Experience is necessary, I admit", says Theophilus to Philalethes, in the *New Essays*, "in order that the mind should be determined to such or such thoughts, and in order that it should take note of the ideas that are in us; but what of the means by which experience and the senses are competent to supply ideas? Is the mind a window? Does it resemble a tablet? Is it like wax? It is clear that all who think thus make the mind material. I shall be met with the received maxim, that there is nothing in the soul which comes not from the senses; but we must make an exception in favour of the soul itself and its affections. *Nihil est in intellectu quod non fuerit in sensu—nisi intellectus ipse*". But on this point there is no difference between Locke and Leibnitz. The exception, so far as it has any real significance, Locke readily admits. He admits that the mind possesses certain "inherent faculties" (I. ii. 2), certain "powers intrinsic and proper to itself" (II. i. 24), certain "natural propensities of thought" (I. iv. 11), certain "principles of common reason" (I. iv. 10), certain principles of "common sense" (I. iii. 4; IV. viii. 2; IV. xviii. 11). All he denies is the existence of innate principles in the form of "characters, as it were, stamped upon the mind of man, which the soul receives in its very first being, and brings into the world with it" (I. ii. 1). He does not deny the modern principle of 'heredity'; but he denies the pre-existence of Pythagoras (II. xxvii. 14), the reminiscence of Plato (I. iv. 20), the latent modifications of Leibnitz (I. ii. 5), the

innate ideas commonly attributed to Descartes—in brief, the “*cognita addit*” which Cicero adopted from Plato (*Tusc.* i. 24), and which Locke regarded as the “established opinion” of the times (i. ii. 1). It may be that the controversy in which Locke thus engaged was in a measure verbal. He repeatedly admits that it was (i. ii. 5; i. ii. 27; i. iii. 13). But it is one thing to contend against misleading phraseology, and another thing to contend against the truth. Locke admits everything for which any reasonable advocate of innate principles can contend. The capacity is innate, he says, though the knowledge is acquired (i. ii. 5). The admission of self-evident principles, he says, depends not on “native inscription” (i. ii. 11), but on their “native evidence” (iv. vii. 10), and the “immediate intuition” of their truth (iv. ii. 1). “Locke”, says Reid, “endeavours to show that axioms or intuitive truths are not innate” (*Reid*, 465). “He does more”, says Sir William Hamilton—“he attempts to show that they are all generalisations from experience; *whereas* experience only affords the occasion on which the native, not innate, or a priori cognitions virtually possessed by the mind itself actually manifest their existence” (*ibid.*). Strange to say, this is the very language of Locke himself in his reply to Lowde. Locke objects to the phraseology of Lowde as “misleading men’s thoughts by an insinuation, as if those notions were in the mind before the soul exerts them, *i. e.* before they are known; *whereas* truly”, he says, “before they are known there is nothing of them in the mind but a capacity to know them when the concurrence of the circumstances which this ingenious author thinks necessary in order to the soul’s exerting them brings them into our knowledge”.

The passage with which Kant commences the Kritik of the Reason may be regarded as the expression of the doctrine with which Locke commences the second book of his Essay on the Understanding:—“That all our knowledge begins with *experience* there can be no doubt; for how is it possible that the faculty of cognition should be awakened into exercise otherwise than by means of objects which affect our senses, and partly of themselves produce representations, partly rouse our powers of

understanding to compare, to connect, or to separate them, and so to convert the raw material of our sensuous impressions into a knowledge of objects, which is called experience". What, then, is the function of *experience*, in the philosophy of Locke, and what is its nature and extent? Not only does it supply the chronological condition for the development of knowledge, but it supplies its material content. In answer to the question, Whence has the mind all the materials of reason and knowledge? Locke replies, "in one word, from experience; in that all our knowledge is founded, and from that it ultimately derives itself" (II. i. 2). This one word unfortunately supplies the sum and substance of all that the critics seem to know of the philosophy of Locke; and they never ask themselves what the one word means. In the first place, what are the materials which experience supplies? The answer of Condillac and his followers is, *sensations* only. But the theory of transformed sensations ignores the fact that, on its own showing, sensations are transformed. It ignores the fact that if sensations are transformed, they can only be transformed by certain operations of the mind. It ignores the fact that of these operations of the mind the mind itself must sooner or later, in point of time, take notice. It ignores the fact that the mind could not take note of its own operations, unless it possessed a capacity of *reflection*. None of these considerations were ignored by Locke, and accordingly he agrees with Kant in regarding the fountain of experience as comprising two sources, sensation and reflection (II. i. 2), or, as he elsewhere terms them, in the very language of the Kritik, *external and internal sense* (II. i. 4; II. xi. 17).

But Locke went further in the path of Kant. In the Kritik it is laid down that our knowledge springs from two main sources in the mind, sensibility and understanding—the one a "receptivity for impressions," the other a "spontaneity in the production of conceptions." Does Locke recognise the spontaneous production of conceptions by the *understanding*? It is here that the philosophy of Locke has been in a peculiar manner misunderstood; and it is here that his own language has most materially contributed to the misunderstanding. Locke undoubtedly lays it down

that "simple ideas, the materials of all our knowledge, are suggested and furnished to the mind only by the two ways, sensation and reflection" (II. ii. 2); he undoubtedly lays it down that "all relation terminates in, and is ultimately founded on, those simple ideas we have got from sensation or reflection" (II. xxviii. 18); nay, he says that "external and internal sensation are the only passages he can find of knowledge to the understanding" (II. xi. 17). But this says nothing more than Kant himself has said. Locke's simple ideas, being merely the ideas which the mind passively receives through sense (II. i. 25), correspond with the sensible intuitions of the Kritik; and in holding that these constitute "the materials" of all our knowledge, Locke merely holds with Kant that the senses external and internal supply "the matter", as distinguished from the form of thought. True, he holds that if a conception of the understanding be "removed from all simple ideas quite, it signifies nothing at all" (II. xxviii. 18); but in this he merely holds with Kant that without material content thoughts are void. For Locke, to do him justice, has abundantly explained himself. Though he tells us that the simple ideas of sense are "the materials and foundations of the rest," he also tells us that there are other ideas which, though not "simple", but "complex", are uncompounded (II. xii. 1), and which the understanding, when "employed about" the simple ideas of the senses, must inevitably "attain unto" (II. xii. 8). Not only does he admit that the understanding can separate, compound, and compare the ideas with which it has been furnished by the senses (II. xii. 1), but he admits that, over and above the simple ideas which the understanding gets from the senses, "there are others it gets from their comparison with one another" (II. xxv. 1). These are the ideas of relation which are "added by the mind" (III. iii. 11). Such is the idea of causation which the mind "collects" in observing the constant changes which occur around it (II. xxi. 4; II. xxvi. 1). Such is the idea of substance, which the mind "supposes", when we find that "we cannot conceive" how the simple ideas of which substances are composed can possibly subsist alone or in each other (II. xxiii. 4). Such

also are the ideas of identity and diversity which we "form" on comparing a thing with itself, and "never finding or conceiving it possible that two things of the same kind should exist in the same place at the same time" (II. xxvii. 1). These ideas of relation, it is true, "terminate in and are concerned about" ideas of sensation and reflection (II. xxv. 9), but, in their abstract nature, they are neither ideas of sensation nor ideas of reflection—they are "*the inventions and creatures of the UNDERSTANDING*" (III. iii. 11).

Nor is this seeing in Homer more than Homer saw. Locke has not left himself at the mercy of the careless reader or the hostile critic. The point was presented to him in a manner which it was impossible for him to evade. The question of the co-operation of the understanding with our faculties of sense in the development of knowledge was forced upon him in his correspondence with the Bishop of Worcester. Stillingfleet raised the question of the origin of ideas and the origin of knowledge as explicitly as Reid or Stewart, as explicitly as Kant or Cousin. In the course of the discussion, Locke admits that the principle of causation is "*a true principle of reason*", on the ground of our "perceiving that the idea of beginning to be is necessarily connected with the idea of some operation, and the idea of operation with the idea of something operating which we call a cause" (*Works*, iii. 61). But it is on the question of substance that he is most explicit. It was the idea which Stillingfleet had selected in proof that sensation and reflection were insufficient to explain "the ideas necessary to reason" (iii. 11). "If the idea of substance be grounded upon plain and evident reason", said Stillingfleet, "then we must allow an idea of substance which comes not in by sensation or reflection" (iii. 19). Locke admits the fact, but says, "*I am sure the author of the Essay of Human Understanding never thought, nor in that Essay hath anywhere said, that the ideas which come into the mind by sensation and reflection are all the ideas that are necessary to reason, or that reason is exercised about*" (iii. 11). "*I never said that the general idea of substance comes in by sensation and reflection, or that it is a simple idea of sensation or reflection, though it be ultimately founded on them; for it is a complex idea, made up of the general idea of some thing*

or being with the relation of a support to accidents. *For general ideas come not into the mind by sensation or reflection, but are the creatures or inventions of the UNDERSTANDING, as I think I have shown*” (iii. 19). Locke is not content with even this. He makes a further effort to explain himself. “To explain myself and clear my meaning in this matter”, he says, “all the ideas of all the sensible qualities of a cherry come into my mind by *sensation*; the ideas of perceiving, thinking, reasoning, knowing, &c., come into my mind by *reflection*: the ideas of these qualities and actions, or powers, are perceived by THE MIND to be by themselves inconsistent with existence; or, as your Lordship well expresses it, ‘we find that we can have no true conception of any modes or accidents, but *we must conceive* a substratum, or subject, wherein they are, *i. e.* that they cannot exist or subsist of themselves’. Hence the MIND perceives their necessary connexion with inherence, or being supported, which being a relative idea, *superadded* to the red colour in a cherry, or to thinking in a man, the mind frames the correlative idea of a support. *For I never denied that THE MIND could frame to itself ideas of relation, but have shown the quite contrary in my chapters on Relation*” (iii. 21).

Let us now consider Locke's views on the origin of knowledge. Our knowledge, he says, is of two kinds—one relating to the agreement or disagreement of our ideas, the other to the correspondence of our ideas with external objects (iv. xi. 13). As to the agreement or disagreement of our ideas with each other, the key-note of misrepresentation has again been struck by Leibnitz. “If Locke”, says Leibnitz, “had sufficiently considered the truths which are necessary and demonstrative, and those which we infer from induction alone, he would have perceived that necessary truths could only be proved from principles which command our assent by their intuitive evidence, inasmuch as our senses can inform us only of what is, not of what must necessarily be”. Yet, not only did Locke consider the necessary and demonstrative truths in question, but the consideration of them pervades the whole of the fourth book of the Essay Concerning Human Understanding. He repeats, till the reader is weary of the repetition, that all demonstration must be based

on "intuitive principles", which are "irresistible as sunshine" (iv. ii. 1)—which are known by their "native evidence" (iv. vii. 10)—which "neither require nor admit of proof" (iv. vii. 19). Not only does he distinguish between what is and what must necessarily be, but he gives the criterion by which they are to be distinguished—the absence or presence of "necessary connexion", of "necessary coexistence", of "necessary dependence and visible connexion", of "evident dependence, or necessary connexion", of "the necessary connexion of the ideas themselves" (iv. iii. 14). Kant himself has not more accurately distinguished between a priori and a posteriori knowledge than Locke has done. He contrasts the "necessary dependence" which is discoverable in our ideas themselves with "the constant and regular connexion" of ideas which we attribute to the "arbitrary determination" of the Creator, and which are discoverable only by "experience" (iv. iii. 28. "In some of our ideas", he says, "there are certain relations, habitudes, and connexions, so visibly included in the nature of the ideas themselves that we *cannot conceive* them separable from them by any power whatsoever, and in these only we are capable of *certain and universal knowledge*" (iv. iii. 29); because, as he proceeds to argue, "the things that, as far as our observation reaches, *we constantly find* to proceed regularly, we may conclude do act by a law set them, but yet by a law we know not, whereby, though causes work steadily, and effects flow from them, yet their connexions and dependencies being not discoverable in our ideas, we can have but an *experimental knowledge* of them" (*ibid.*). Or, take another passage. "General and certain truths", he says, "are only founded in the habitudes and relations of abstract ideas", and "a sagacious and methodical application of our thoughts, for the finding out these relations, is the only way to discover all that can be put with truth and certainty concerning them into general propositions" (iv. xii. 7). "What, then", he asks, "are we to do for the improvement of our knowledge of substantial beings?" "Here", he says, "we are to take a quite contrary course; the want of ideas of their real essences sends us from our own thoughts to the things themselves as they exist—EXPERIENCE *here must teach us what* REASON

*cannot, and it is by trying alone that I can certainly know what other qualities coexist with those of my complex idea*" (iv. xii. 9).

What is it then that Locke, on the principles of Kant, has left undone? He distinguishes between objective and subjective knowledge (iv. iv. 3; iv. xi. 13). He distinguishes between analytic and synthetic propositions (iv. viii. 8), and lays down the "infallible rule" by which they are to be distinguished (iv. viii. 13). He distinguishes between synthetic a priori and synthetic a posteriori judgments (iv. iii. 29; iv. xii. 7). He distinguishes between experience and reason (*ibid.*). And hence it is that he is enabled to accomplish his design and to give an answer to the inquiries with which he started (i. i. 2). The "original" of knowledge is to be discovered in experience (ii. i. 2); its "certainty" is based on intuition (iv. ii. 2); its "extent" is determined by our perception of the identity, co-existence, and relation of our ideas, and the existence of their corresponding objects (iv. iii. 7), so far as it is revealed to us by intuition on the one hand, or by experience on the other (iv. iii. 29). On these principles Locke holds that mathematics, as based on ideas the agreement or disagreement of which may be "intuitively perceived", is capable of demonstration (iv. ii. 9). On these principles he shows that moral science may be deduced "from self-evident propositions, by necessary consequences as incontestable as those in mathematics" (iv. iii. 18). On these principles he contends that the existence of God may be proved by "a regular deduction of it from some part of our intuitive knowledge," with an "evidence equal to mathematical certainty" (iv. x. 1). Such is the empiricism—such is the sensualism of John Locke. But, unfortunately for philosophy, the error as to his true character has become inveterate. It is embodied in all the histories of philosophy. It is stamped with the authority of great men, whose writings are in every hand, and whose names are upon every tongue. For two hundred years Locke has been regarded as a mere empiric; and it is to be feared that, in spite of all that may be said to the contrary, he will be so regarded to the end of time.

## NOTE B.

## HOBBS : ON GENERAL REASONING.

No exposition of the philosophy of either Locke or Berkeley would be complete without a consideration of their opinions as to abstract ideas and general names; and to discuss this question with effect we must go still farther back, and examine the views of the founder of modern Nominalism—Hobbes.

The life of Hobbes was unusually protracted. He was born at Malmesbury in 1588, the year of the Armada, and he died at Hardwicke, in 1679, the year of the Exclusion Bill. He lived under five sovereigns. He was the amanuensis of Bacon. He was twenty-eight when Shakspere died. He was twenty when Milton was born, and he survived him. He died when Locke was forty-seven. His life therefore covers the whole period from the *Novum Organum*, which he translated into Latin, to the *Essay Concerning Human Understanding*, which was in preparation when he died. In the interval Hobbes wrote and published the *De Cive*, the *Leviathan*, and the *Human Nature*. Though he did not commence his philosophical writings till he was close upon the verge of sixty, he produced the most powerful effect, not only upon his own age but upon succeeding ages. He was the founder of modern political philosophy. In enunciating the principles of the utilitarian system he anticipated Bentham. In all that is essential to the science of jurisprudence he anticipated Austin. The influence of his philosophy is visible in Locke, in Berkeley, and in Hume. But his passion for paradox was so great, and he clothed the most innocent truisms in such obnoxious forms, that he aroused a feeling of personal hatred so violent that not only was the whole church militant thundering on his head-piece during his life, but nearly two hundred years afterwards an election mob greeted the editor of his works with the cry "No

Obbes !” As usual, detraction followed in the footsteps of dislike, and no philosopher in the annals of misrepresentation has been so systematically misrepresented as the founder of the Nominalism of modern times.

The controversy between the Realists and Nominalists is one of the most remarkable in the history of the world. The schools resounded with its discussion ; but the discussion was not confined to the limits of the schools. It was maintained by rival theologians, who mutually accused each other of the unpardonable sin. It procured the martyrdom of Huss. It deluged the streets of Paris with blood. Like the controversy of the Guelfs and Ghibellines, it distracted medieval Europe. Emperors and kings took up arms on the question of universals *a parte rei* ; and, according to John of Salisbury, more money was expended on the contest than was laid up in the treasure-house of Croesus, more time was consumed in its discussion than was required to consolidate the empire of the Caesars.

To the ordinary reader the dispute as to the nature of universals which thus convulsed the middle ages is apt to suggest the dispute as to the primitive way of breaking eggs which embroiled the Emperor of Lilliput and the Emperor of Blefuscu. But to the philosopher it suggests topics of interest, which, even in these days when physical science is predominant, continue to agitate the minds of men. The question as to the origin of species is only another form of the inquiry as to the nature of universals *a parte rei* ; and though the hypothesis of protoplasm and evolution has taken the place of the hypothesis of substantial forms, they equally belong to that metaphysical aspect of the question which every physical science of necessity presents. The questions as to the origin of language, again, which within the last few years have been popularised by the ability of Max Müller, are only a phase of the question raised by the Nominalists as to the origin of general terms. These questions, however, belong to the domains of physiology and philology rather than to the domain of abstract thought ; and the question in which the mere philosopher is interested relates exclusively to the nature of universals in the mind. What

is the object present to the mind in its general reasonings? Is it a thing, an idea, or a name? Is the Realist or the Conceptualist, or the Nominalist, right?

Unfortunately, such are the ambiguities of language, that before we can discuss the subject we must consider the preliminary question, What are the doctrines which the Realist, the Conceptualist, and the Nominalist actually held? This question is exhaustively discussed by Brown, and we cannot do better than take the opinions attributed to the contending sects from him. According to Brown, the Realist maintained that the universal *parte mentis* is a "species distinct from the mind, which, of course, could not be particular, like the sensible species, but universal, so as to correspond with the universality of the notion and the generic term" (*Lect. ii.* 458). The Nominalist is supposed not only to deny the existence of intelligible species, but also to "deny the existence of that peculiar class of feelings or states of mind which have been denominated general notions, or general ideas, asserting the existence only of individual objects perceived, and of general terms that comprehend them, without any peculiar mental state denoted by the general term" (p. 464). The Conceptualist, in his turn, is supposed to maintain that the object of the mind in reasoning is not an arbitrary symbol, but an abstract idea, "a notion of an object uniting at once all the qualities of the individual objects, yet excluding every quality which distinguishes each from each" (p. 483).

But the more absurd a doctrine appears to be, the less likely is it to have been actually held by any reasonable man; and when a critic, however intelligent, conceives a great philosopher to have been a fool, it is within the limits of possibility that the fool after all may be, not the philosopher, but the critic. Before we ridicule we should refute, and before we refute we should strive to understand, and before we can understand we must carefully weigh the language of our author. Let us try, then, in the first place to understand what was meant by the *intelligible species* of the schools. As the type of modern Realism we may take the modern Platonist, who was the greatest of the antagonists of Hobbes. Cudworth, like his master, holds that "the immediate

objects of intellection and science are eternal, necessarily existing, and incorruptible". But he immediately proceeds to obviate the misconception into which Brown was betrayed upon the point. He tells us that "the rationes and essences of things are not dead things, like so many statues, images, or pictures hung up somewhere by themselves alone in a world: neither are truths mere sentences and propositions written down with ink upon a book" (*ibid*). He tells us that, on the contrary, "the rationes, intelligible essences, and verities of things, are nothing but noemata, that is, objective notions or knowledge, which are things which cannot exist alone; but together with that actual knowledge in which they are comprehended they are the modifications of some mind or intellect" (*ibid*). As modifications of intellect or mind, in other words, as cognitive acts, intelligible species were not denied by the founders of Nominalism (*Reid*, 954), and accordingly on this point Cudworth and Ockham are agreed.

The criticism of Leibnitz upon the sage of Malmesbury is one of the commonplaces of the history of philosophy. According to Leibnitz, Hobbes was *plus quam Nominalis*—a Nominalist and something more—*non contentus enim cum Nominalibus universalia ad nomina reducere, ipsam rerum veritatem ait in nominibus consistere, ac, quod majus est, pendere ab humano arbitrio, quia veritas pendeat a definitionibus terminorum, definitiones autem terminorum ab arbitrio humano*. Now Hobbes, in his *Computation*, undoubtedly states that "the first truths were arbitrarily made by those that first of all imposed names upon things, or received them from the imposition of others" (*Works*, i. 36). But his paradox that all truth is arbitrary is of a piece with his paradox that no law can be unjust. All depends on what we are to understand by truth and law. The fact is, that each proposition is a platitude rather than a paradox. If truth be thought expressed in words, and if words be arbitrarily selected, then it is an identical proposition that truths are arbitrarily made. The whole mystery is cleared away in the *Leviathan*. Though "true and false are attributes of speech, not of things", and though, "where speech is not, there is neither truth nor falsehood", yet "*error* there may be, as when we expect that which shall not be, or suspect what hath not

been", albeit, "in neither case can a man be charged with *untruth*" (iii. 23). Whether Hobbes was right or wrong in considering language to be arbitrary, he is undoubtedly right [in his conception of the relations which subsist between the thing, the idea, and the name. "A name is a word taken at pleasure, to serve for a mark which may raise in our mind a thought *like* to some thought we had before, and which, being pronounced to others, may be to them a sign of what thought the speaker had, or had not, before in his mind" (i. 16). But names are "signs of our conceptions" (i. 17); and, "one universal name is imposed on many things for their *similitude* in some quality or other accident" (iii. 21). Accordingly Hobbes tells us that "a man that seeketh precious truth had need to remember what every name he uses stands for, and to place it accordingly, or else he will find himself entangled in words, as a bird in lime-twigs—the more he struggles the more belimed" (p. 23). He tells us "that in the *right* definition of names lies the first use of speech, which is the acquisition of science" (p. 24); and he concludes his discussion with the weighty apophthegm, that "words are wise men's counters, they do but reckon by them; but they are the money of fools, that value them by the authority of an Aristotle, a Cicero, or a Thomas, or any other doctor whatsoever, if but a man" (p. 25).

What then were the views of Locke upon the subject? The philosopher of the revolution was no admirer of the philosopher of the restoration. He professed to be but slightly acquainted with his works, and seems to have thought so slightly of them that, in enumerating the works on the original of society, and the extent of political power, which had appeared within the previous sixty years, he is silent on the *Leviathan* and the *De Cive*, and mentions only the Ecclesiastical Polity of Mr. Hooker, the Discourses on Government of Mr. Algernon Sydney, and a Treatise of Civil Polity by Mr. Paxton (*Works*, ii. 408). But the similarity of the views of Hobbes and Locke on the question of universals is not to be concealed. Locke holds that "truth and falsehood properly belong to propositions" (ii. xxxii. 1). He holds that mixed modes are arbitrary

(III. v. 3). He "would not be thought to forget, much less to deny, that nature in the production of things makes several of them alike"; but he thinks "we may say the sorting of them under names is the workmanship of the understanding, taking occasion, from the *similitude* it observes among them, to make abstract general ideas and set them up in the mind, with names annexed to them, as patterns or forms to which as particular things existing are found to agree, so they came to be of that species, have that denomination, or are put into that classis" (III. iii. 13); or, as he elsewhere expresses it, are determined to be of that "sort" (III. iii. 6, 12). "Ideas", he says, "become general by separating from them the circumstances of time and place, and any other ideas that may determine them to this or that particular existence" (III. iii. 6). This process of abstraction he regards as the prerogative of man; and he delights in magnifying the difficulties that attend it. "General ideas", he says, "are fictions and contrivances of the mind, that carry difficulty with them, and do not so easily offer themselves as we are apt to imagine". "Does it not require some pains and skill", he asks, "to form the general idea of a triangle (which is yet none of the most abstract, comprehensive, and difficult), for it must be neither oblique, nor rectangle, neither equilateral, equicrural nor scalenon; but all and none of these at once"—"in effect it is something imperfect that cannot exist; an idea wherein some parts of several different and inconsistent ideas are put together" (IV. vii. 9).

But it is never with impunity that a writer sacrifices precision to point. Locke's abstract idea of a triangle is as enigmatical as the Aelia Laelia Crispis of the schoolmen; and accordingly from the first it has been the butt of philosophers and wits. Arbuthnot, in the *Memoirs of Scriblerus*, could find no parallel for it but Crambe's Abstract of a Lord Mayor. Berkeley, in the Introduction to his *Principles of Human Knowledge*, found it hard to imagine that a couple of children could not prate of their sugar-plums and rattles till they had tacked together a number of inconsistencies and framed abstract general ideas (*Intr.* xiv.). Brown considers the passage as unworthy of its great

author, and as abundantly ridiculous (*Lect.* xlvii.); while Hamilton declares that Locke held the conceptualist doctrine in its most revolting absurdity, contending that the general notion must be realised in spite of the principle of contradiction (*Lect.* ii. 300). But Locke's critics, to use Locke's metaphor, have all been lost in the great wood of words. They have failed to observe that parts of inconsistent ideas are not necessarily inconsistent, and that ideas may be obtained by abstraction without being capable of being imaged in the abstract. The abstract idea is not so much an idea as a "measure of name" (iii. iii. 14), and it is the very essence of a definition that it should comprehend all particulars and be identified with none. Locke, in fact, repudiates the absurdity with which he has been charged. "If", he says, "I put in my ideas of mixed modes or relations any inconsistent ideas together, I fill my head also with chimeras; since such ideas, if well examined, cannot so much as exist in the mind, much less any real being ever be denominated from them" (iii. x. 33).

The doctrine which Hume attributes to Berkeley is, that "all general ideas are nothing but particular ones annexed to a certain term, which gives them a more extensive signification, and makes them recall upon occasion other individuals which are similar to them"; and Hume looks on this as "one of the greatest and most valuable discoveries that had been made of late years in the republic of letters" (i. 34). But Berkeley said nothing which had not previously been said by Locke. He says it is true in fancied opposition to Locke that he does not "deny that there are general ideas, but only that there are any *abstract* general ideas" (*Intr.* xii.), and that "it is one thing for to keep a name constantly to the same *definition*, and another to make it stand everywhere for the same *idea*" (§ xviii.). But these are mere verbal misunderstandings. Berkeley acknowledges that "a man may consider a figure merely as *triangular* without attending to the particular qualities of the angles or relations of the sides" (§ xvi.). He holds that "an idea, which considered in itself is particular, becomes general by being made to represent or stand for all other particular

ideas of the same sort" (*Int.* xii.). He insists it is true that "it is not necessary, even in the strictest reasonings", that "significant names which stand for ideas should, every time they are used, excite in the understanding the ideas they are made to stand for" (§ xix.). But on this point Locke agrees with Berkeley. He admits everything for which a Nominalist can reasonably contend. He concedes that "most men, if not all, in their thinking and reasonings make use of words instead of ideas" (iv. v. 4). He does not contend that "a man need stand to recollect and make an analysis" of the meaning of the word every time he happens to employ it (iii. xi. 9)—all he insists on is, "that he have so examined the signification of that name, and settled the idea of all its parts in his mind, that he can do it when he pleases" (*ibid.*)

How then are we to arbitrate between the contending sects? The materials for an arbitration exist, and, if not obvious, yet when pointed out must be admitted by reasonable men. It must be admitted that in our general reasonings we employ words, without any conscious reference to their meaning, and merely as algebraic symbols. It must be admitted, at the same time, that, if our reasonings are not to end in nonsense, our words must have a meaning, and that their meaning must be determined by their definition, whether denominated abstract idea, scheme, or concept. It must be admitted, moreover, that if our general reasonings are to conduct to any practical result, our conceptions should not be mere chimeras, but should accord with the facts of nature and the realities of things. But then again it must be admitted that everything which exists, whatever may be the physical cause that determines the mode of its existence, is *particular*. At the same time it cannot be denied that in contemplating a multitude of particulars the mind is struck with a sense of their *resemblance*, and that it selects the point of resemblance by a process of abstraction and combines them into a scheme or concept. But can this scheme or concept be present to the mind as an image or idea? No; and even if it could be, it would be *particular*. The only means of *generalising* it and keeping its abstracted elements together is by the imposition of a name. The

name, the idea, and the thing, are thus relegated to their natural rights, and are placed in their natural relations. What, then, is each party called on to renounce? Nothing but the privilege of attributing absurdity to its opponents. The mental facts are all agreed on, and nothing is to be abandoned but the *unintelligible* species attributed to Scotus, the unmeaning symbolism attributed to Hobbes, and the self-contradictory ideas attributed to Locke.

NOTE C.

BACON : ON INDUCTIVE REASONING.

THE three first names in English philosophy are Bacon, Hobbes and Locke ; and it is hard to say which of these great men has been most generally magnified, and, at the same time, most generally misunderstood. In one point Locke and Bacon have been subjected to a common error. Both have been regarded as champions of the *Empiricism* which, according to the critics, is characteristic of their nation (*Schw.* 153, 181).

So far was Bacon from being a mere empiric, that the whole object of his philosophy, as stated in his *Distributio Operis*, was to effect a reconciliation between the rational and the empiric faculties, the divorce of which, he said, had thrown all human affairs into confusion. The true process of science, he said in his *Novum Organum*, was neither that of the ant, which merely stores what it has collected from without, nor that of the spider, which spins everything from within, but that of the bee, which gathers its material from the flowers of the garden and the field, and by its own faculty digests them and converts them into honey. The influence of reason in the development of science from experience is never for a single moment either denied or ignored by Bacon. In his *Philosophia Prima* he anticipates Kant, and attempts to enumerate the transcendental axioms and notions which are assumed in all physical investigation. In his *Topica Particularis* he adopts the words of Plato, and declares that he who seeks anything in nature must comprehend it in some general notion, in order to recognize it when he finds it. In his *Interpretatio Naturae* he analyzes the process by which the form is elicited by reason from the facts furnished by experience, and makes mental anticipation the first step in the process of induction.

The nature of the inductive process has been the subject of bitter and long-continued controversies. But the fact is, the word induction, like every other philosophical term, is used in a variety of senses, and this occasions an apparent variety of opinions where, in reality, none exists. *Logical Induction*, as it may be called, is a process which goes upon the self-evident fact, that what belongs or does not belong to all the constituent parts, belongs or does not belong to the constituted whole. It is merely the converse of the syllogistic process, and belongs exclusively to the domain of logic. A like remark may be made with respect to the *Psychological Induction*, as it may be termed, of Mill, who defines induction to be "the operation of the mind, by which we infer that what we know to be true in a particular case, or cases, will be true in all cases which resemble the former in certain assignable respects" (*Log.* i. 319). But this inference from the known to the unknown is merely an expression of our belief in the continuance of the laws of nature; and this belief, though the basis of all our experimental inquiries, and the condition of their application, is not so much an inference from experimental data as an anticipation of experience; and whether it be regarded as an instinct, as a category, or as a transcendent, it must be relegated to psychology, as the logical induction was to logic. The object of induction, as Bacon conceived the process, was to ascertain the laws of nature, and not to explain our belief in their continuance. The cause, the law, or, to use Bacon's term, the form, of any set of phenomenon can only be elicited from the facts; and the facts can only be ascertained by a patient interrogation of nature, conducted on a preconceived plan (*topica particularis*), the results of which, to be available, should be methodically recorded (*experientia literata*). But the interpretation of nature should follow its interrogation; and the form which explains the facts ascertained by observation and experiment must be discovered by induction. This process may be styled *Physical Induction*, for the purpose of distinction; and, according to Bacon, there are two ways in which it may proceed. The form being unknown can, in the first instance, be merely matter of conjecture; but

when the mind has formed its conjecture it must proceed to test its truth by a reference to the facts. This it may do, in a hasty and perfunctory manner, by an enumeration of the particular instances in which the form appears to exist, without inquiring into the analogous instances in which it does not exist, and so conclude that it is the form. This is the *Induction by Simple Enumeration* which Bacon considered a precarious method of inquiry—a method leading to results which may be neutralized by the first contradictory instance that presents itself—a method which affords no exit from the labyrinth of facts into the light of law. Precario concludit, et periculo ab instantiâ contradictoriâ exponitur, et consueta tantum intuetur, nec exitum reperit. In opposition to this, he insists on the employment of an *Induction by Exclusion*—a form of induction quae experientiam solvat et separet, et per exclusiones ac rejectiones debitas necessario concludat—a process which considers the facts that experience has furnished, forms hypotheses as to their laws, rejects every hypothesis which is inconsistent with the facts observed, and inducts the true hypothesis after the rejection of those which are demonstrably false

In his *Impetus Philosophici* Bacon supplies a formula to determine whether any given hypothesis for the explanation of a set of observed phenomena should be rejected. Omnes naturae quae aut datâ naturâ praesente adsunt, aut datâ naturâ absente adsunt, ex formâ non sunt; atque post rejectionem aut negationem completam manet forma et affirmatio. This, he said, was a brief remark, but it embodied a conclusion at which he had only arrived by a long and patient course of thought. In the *Novum Organum*, however, after still deeper meditation on the subject, he gives a formula more comprehensive and correct. Invenienda est enim super comparentiam omnium et singularium instantiarum natura talis, quae cum naturâ datâ perpetuo adsit, absit, atque crescat et decrescat (II. xv.). These formulae, it is plain, are a compendious expression of Mill's canons of agreement, difference, and concomitant variations, and they show how completely Bacon, in the infancy of physical science, anticipated all the logical principles on which, in its maturity, it proceeds.

Instead of illustrating the Baconian method by trivial or ridiculous instances, let us illustrate it by the process which conducted physical investigation to its greatest triumph—the discovery of the laws which regulate the planetary movements. The facts of the celestial motions had been observed from the earliest times, and records of those observations had been made generations ago by the Assyrian, the Egyptian, and the Greek. But what was the law of those familiar motions? It was not known; and in the first place it could only be provisionally guessed. Was the motion in a line, a spiral, or a curve? Did the earth revolve around the heavenly bodies, or did the heavenly bodies revolve around the earth? The hypothesis of sidereal revolution was embraced. It explained the more obvious phenomena of the heavens; but fact after fact was observed which it was incompetent to explain. It was in vain that astronomers strove to modify the original hypothesis by subsidiary hypotheses, and imagined “cycle and epicycle, orb on orb”. In the felicitous language of Whewell, the conception could not colligate the facts. Accordingly, the hypothesis of Hipparchus was at last rejected; and Copernicus, in order to explain the facts of the celestial movements, embraced the hypothesis that the earth revolved around the planets in a circle. But though the circular hypothesis explained a multitude of facts, there were facts which even it was unable to explain. It was in vain that Copernicus again introduced the epicycle in the form of an equalizing circle; his hypothesis was in its turn rejected. After so many rejections a new hypothesis was formed by Kepler—the hypothesis of an elliptic orbit. The problem of the heavens was solved. The hypothesis of an elliptic orbit explained every phenomenon that had been observed. The infinitesimal calculus was invented by Newton; astronomy was converted into a branch of mathematics; and, after so many anticipations and so many rejections, the great cosmical hypothesis was inducted to its place of honour as the highest type of science.

It is evident from what has been said, that in point of logic the Baconian induction is a disjunctive syllogism, of which the

major premiss is the sum total of the hypotheses which the mind can form in order to explain the facts. The law of the phenomena must be either this or that or the other theory; it is neither this nor that; therefore it must be the other. The major is thus supplied by the anticipations of the mind; the minor is the rejection of all anticipations which are inconsistent with the facts of nature; the conclusion is the induction. As Bacon himself expresses it, a variety of opinions are formed; all volatile opinions disappear as smoke; and the true solid and affirmative result remains.

The mention of syllogism suggests another matter in which injustice has been done to Bacon. According to Mill, he "leaves no room for the discovery of new principles by way of deduction"; and he adds, that "it is not to be conceived that a man of Bacon's sagacity could have fallen into this mistake, if there had existed in his time among the sciences which treat of successive phenomena one single deductive science, such as mechanics, astronomy, optics, acoustics, &c., now are" (*Logic*, ii. 451). This is as curious a misrepresentation as could well be made. In Bacon's correspondence there is a letter to the Redemptorist Father Baranzan, in which he distinctly states that when the original facts and primary laws of nature have been ascertained by induction the syllogistic method may be used. In *physicâ prudenter notas, et idem tecum sentio, post notiones primæ classis, et axiomata super ipsas per inductionem bene eruta et terminata, tuto adhiberi syllogismum, modo inhibeat saltus ad generalissima et fiat progressus per scalam convenientem*. Nay, so far was Bacon from being betrayed into the alleged mistake by the fact that no deductive science existed in his time, that he actually *predicts* the advent of the very sciences which were destined to form the proudest triumph of the deductive method. *Multæ naturæ partes, nec satis subtiliter comprehendi, nec satis perspicue demonstrari, nec satis dextre et certo ad usum accommodari, possunt sine ope et interventu mathematicæ; cujus generis sunt perspectiva, musica, astronomia, cosmographia, machinaria, et nonnullæ aliæ. Cæterum in mathematicis mixtis integras aliquas portiones deside-*

ratas jam non reperio, sed multas in posterum *praedico* si homines non ferientur; prout enim physica majora indies incrementa capiet, et nova axiomata educet, eo mathematicae operâ novâ in multis indigebit, et plures fient mathematicae mixtae (*De Aug.* iii. vi.).

One word still remains to be said. The tendency of Lord Macaulay's celebrated essay on Bacon is to give his philosophy a far more material and utilitarian aspect than it really bears. We are told that Bacon indulged in no rants about the fitness of things, or the dignity of human nature—that he said nothing about the grounds of moral obligation or the freedom of the human will—that he paid no attention to the casuistical subtleties which occupied the attention of the keenest spirits of the age. Nothing could be more misleading. The book of the *De Augmentis*, which he devotes to moral philosophy, contains a refutation of all these statements. He praises the philosophers, for the manner in which they had treated ideal excellence. He regards them, however, as surpassed by the pious and strenuous diligence of the theologians, in their treatment of the moral virtues and cases of conscience, and the delimitations of sin. He speaks of the higher power and dignity of the *bonum communionis* and the *bonum activum*, as compared with the selfish cares and passive enjoyment of life. He speaks of an approach to the divine or angelic nature as the perfection of our moral form; and with Aristotle, he proposes heroic and divine virtue as the scope of all our moral aims. The two words, says Lord Macaulay, which are the key of Bacon's philosophy are, utility and progress. Even this is not correct. The key of his doctrine was not utility and progress, but utility and *truth*. *Propositum a nobis est, non rerum pulchritudinem sed usum et veritatem sectari*. Nay more, the great experimental philosopher places truth before utility in his estimate of their relations. In his *Aphorisms* he asserts that the contemplation of truth is something for higher and worthier than any mere utility—*esse contemplationem veritatis omni operum utilitate et magnitudine digniorem et celsiorem* (*Nov. Org.* i. lxxiv). And in his *Essays* are the words, which every man of education has by

heart: "Howsoever these things are in men's depraved judgments and affections; yet truth, which only doth judge itself, teacheth, that the inquiry of truth, which is the love-making or wooing of it; the knowledge of truth, which is the presence of it; and the belief of truth, which is the enjoying of it; is the sovereign good of human nature".

## NOTE D.

HUME : ON MIRACLE AND NATURE.

SIR JAMES MACKINTOSH, in his Dissertation on the Progress of Ethical Philosophy, which still maintains its time-honoured place in the *Encyclopædia Britannica*, regards Hume as a professor of UNIVERSAL SCEPTICISM, and remarks that "the Sceptic boasts of having involved the results of experience and the elements of geometry in the same ruin with the doctrines of religion and the principles of philosophy" (*Works*, i. 137). How erroneous this criticism is we have already seen. We have seen that Hume systematically distinguishes between the results of experience and the elements of geometry (iv. 190)—that he protests against confounding the principles of philosophy with the principles of action (iv. 47)—that he maintains we are under the necessity of acting upon beliefs which no reasoning is able either to produce or to prevent (iv. 56), and that he holds the fundamental doctrines of religion to be based on the principle of natural and necessary faith (iv. 192).

Sir James Mackintosh, still speaking of Hume, remarks, with reference to his views on NATURAL RELIGION, that "to those who are strangers to the seductions of paradox, to the intoxication of fame, and to the bewitchment of prohibited opinions, it must be unaccountable, that he who revered benevolence should, without apparent regret, cease to see it on the throne of the universe" (i. 135). But to those who are strangers to the bewitchments of criticism it must be equally unaccountable that Mackintosh should have been betrayed into such a misconception of Hume's opinions, and that he should have considered it necessary to deprive natural religion of the authority of the most profound metaphysical thinker that these countries have produced. Twice has Hume written on the subject of Natural

Religion, once in his *Natural History*, and again in the *Dialogues* which were posthumously published, and in each of those works he repudiates the atheism which is attributed to him by his critic. In his *Natural History of Religion* he protests that "the whole frame of Nature bespeaks an Intelligent Author", and that "no rational inquirer can, after serious reflection, suspend his belief a moment with regard to the primary principles of genuine Theism and Religion" (*Works*, iv. 435). In his *Dialogues* concerning Natural Religion he is still more emphatic. Cleanthes, whose opinions he accepts (ii. 548), maintains that "the most agreeable reflection which it is possible for human imagination to suggest is that of genuine Theism, which represents us as the workmanship of a Being perfectly good, wise and powerful, who created us for happiness, and who, having implanted in us immeasurable desires of good, will prolong our existence to all eternity, and will transfer us into an infinite variety of scenes, in order to satisfy those desires, and render our felicity complete and durable" (ii. 543). He insists on "the curious adapting of means to ends", which is found "throughout all nature", as supplying an argument by which we prove at once the existence of "the Author of Nature" and his wisdom (ii. 440). He says that the conscience of the Sceptic or Atheist must be scrupulous, indeed, if he refuses to call the universal unknown cause a Deity or God (ii. 459). And, finally, in the following passage he lays aside the philosophic calm which he generally affects, and bursts into an impassioned strain of eloquence, which might well be mistaken for one of the pious rhapsodies of Berkeley. "The order and arrangement of nature, the curious adjustment of final causes, the plain use and intention of every part and organ, all these bespeak in the clearest language an intelligent cause or author. The heavens and the earth join in the same testimony. The whole chorus of nature raises one hymn to the praises of its Creator. You [the Sceptic] alone, or almost alone, disturb this general harmony. You start abstruse doubts, cavils, and objections. You ask me what is the cause of this cause? I know not; I care not; that concerns not me. I have found a Deity, and here I stop my inquiry" (ii. 465, 6).

These passages reflect a vivid light on Hume's opinion on the general subject of CAUSATION. "Mr. Hume's theory of causation", says Mackintosh, "is used as an answer to arguments for the existence of the Deity, without warning the reader that it would equally lead him not to expect that the sun will rise to-morrow" (*Works*, i. 138). Here again we have a criticism which not only misrepresents Hume, but involves a number of philosophical questions in confusion. Hume, as we have seen, recognises the principle of *efficient causes* as the ground of our belief in the existence of a God, while he recognises the principle of *final causes* as the ground of our belief in his intelligence and goodness. As regards *natural causes*, he has the conspicuous merit of being the first to popularise, if not to establish, what is now an accepted truth, that the sole object of the physical inquirer is to ascertain the *constant conjunction* of phenomena in the vast sequence of changes which constitute the laws of nature. This is Hume's theory of causation in the proper sense. But the existence of these constant conjunctions in the past is no guarantee for their continuance in the future. That the sun rose yesterday is no proof that he will rise to-morrow. Our belief in the *future continuance* of the conjunctions which we have experienced is not to be accounted for by mere experience, according to Hume, but by an instinct of our nature called into play by the recurrence of the phenomena which we have experienced, and supplying a fresh instance of the principle of final causes (iv. 65).

Hume's theory of causation naturally suggests a topic which has subjected him to greater obloquy than even his supposed scepticism—his views as to the nature of MIRACLES, and the evidence by which they are supported. He defines a miracle to be "a transgression of a law of nature by a particular volition of the Deity, or by an interposition of some invisible agent" (iv. 134). Let us consider the question in its philosophic aspect merely. Recognising as he does the existence of a Deity, Hume, by the principles of his philosophy, is bound to admit that there is no a priori objection to accepting a mere volition for a cause. "If we reason a priori", he says, "anything may appear able to produce anything"—"the falling of a pebble may, for aught we

know, extinguish the sun, or the wish of a man control the planets in their orbits" (iv. 191; i. 315). The existence of any matter of fact, on his theory, is incapable of demonstration; and all arguments for its existence must be based upon experience alone (iv. 191). In short, it is a "general maxim" with Hume, "that no objects have any discoverable connexion together, and that all the inferences which we can draw from one to another are founded merely on our experience of their constant and regular conjunction" (iv. 130).

Let us then view the matter a posteriori. "A miracle", says Hume, "is a violation of the laws of nature, and as a firm and unalterable experience has established these laws, the proof against a miracle is as entire as any argument from experience can possibly be imagined" (iv. 133). But this, surely, is a mere begging of the question. For in the first place, is a miracle a *violation* of a law of nature? On Hume's theory of causation nature is a mere series of antecedents and consequents, and the expression of a law of nature is simply this—the antecedent A, in our past experience, has been constantly followed by the consequent B, the death of a man, for instance, by the dissolution of his body. A miracle is confessedly an unusual occurrence, and on the theory of observed sequences its expression would be this—the antecedent X, has been followed by the consequent Y, the volition of a divine person, for instance, by a resurrection from the dead. Here a new antecedent has been introduced, and a new consequent has followed. This, it is evident, is not a violation of the old sequence, but the introduction of a new one. If the new consequent, the resurrection from the dead, be regarded as an interference with the old consequent, the dissolution of the body, even this cannot be regarded as a violation of the laws of nature, for it is a contingency to which every law of nature is subject—the intervention of a counteracting cause.

To say, then, that the laws of nature are established by an *unalterable* experience is misleading. Dr. Haughton, in his admirable Lectures on Physical Geography, published in the Dublin University Series, describes the scientific law of the uniformity of nature as "a shallow creed" refuted by the science of Geology,

"from which we learn that the present is unlike the past, and will probably be still more unlike the future" (p. 75). But neither Hume nor Dr. Haughton, as I venture to think, has formed a true conception of the law in question. Its true expression is to be found in the opening chapter of the *Analogy*. "There is in every case a probability," says Butler, "that all things will continue as we experience they are, in all respects, *except* those in which we have some reason to think they will be altered".

"It is a miracle that a dead man should come to life", says Hume, "because that has never been observed in any age or country" (p. 134). Again, this begs the question. The question we are discussing is whether a resurrection, such as that of Lazarus, has been observed. This can only be determined by the testimony of observers. Hume lays it down as "a maxim that no human testimony can have such force as to prove a miracle" (iv. 150). But a miracle, after all, as distinguished from a law of nature, is merely an extraordinary occurrence. It may well be that, if we were admitted to a wider view of the universe, as Butler suggests, we might find that the occurrence of miracles is subjected to a law as rigorous as, for instance, the secular appearance of a comet. All we can say is, that a miracle, if it occurred, was an extraordinary, or, if you will, a singular occurrence. But if a singular occurrence cannot be established by testimony, nothing can be so established. The repeated occurrence of the most ordinary event is merely the repetition of a series of singular occurrences, and if the evidence for each of them be regarded as a cypher, it is plain that no multiplication of cyphers will constitute a unit.

This brings us to the real point of the whole matter. What is the *evidence* in favour of miracles, and how is that evidence to be regarded? Hume lays down another "general maxim" (iv. 134). He says that "no testimony is sufficient to establish a miracle unless the testimony be of such a kind that its falsehood would be more miraculous than the fact which it endeavours to establish" (p. 134). This is merely a play on the word miraculous. The true statement of the case is made by Mr. Mill. "The improbability, or, in other words, the unusualness, of any

fact is no reason for disbelieving it, if the nature of the case renders it certain that either that or something equally improbable, that is, equally unusual, did happen" (*Log.* ii. 168). "All, therefore, which Hume has made out", again to use the words of Mr. Mill, "is that no evidence can prove a miracle to anyone who did not previously believe the existence of a being or beings with supernatural powers ; or who believes himself to have full proof that the character of the Being whom he recognises is inconsistent with his having seen fit to interfere on the occasion in question" (p. 162). But Hume, with all his dogmatism, never pretended to be furnished with any such proof ; and Hume, with all his scepticism, was a firm believer in the being and attributes of God.

## DUBLIN UNIVERSITY PRESS SERIES.

---

THE PROVOST and SENIOR FELLOWS of Trinity College have undertaken the publication of a Series of Works, chiefly Educational, to be entitled the DUBLIN UNIVERSITY PRESS SERIES.

The following volumes of the Series are now ready, viz. :—

**Six Lectures on Physical Geography.** By the REV. S. HAUGHTON, M.D., DuBL., D.C.L., Oxon., F.R.S., *Fellow of Trinity College, and Professor of Geology in the University of Dublin.* 15s.

**An Introduction to the Systematic Zoology and Morphology of Vertebrate Animals.** By ALEXANDER MACALISTER, M.D., DuBL., *Professor of Comparative Anatomy in the University of Dublin.* 10s. 6d.

**The Codex Rescriptus Dublinensis of St. Matthew's Gospel (Z).** First Published by Dr. Barrett in 1801. A New Edition, Revised and Augmented. Also, Fragments of the Book of Isaiah, in the LXX. Version, from an Ancient Palimpsest, now first Published. Together with a newly discovered Fragment of the Codex Palatinus. By T. K. ABBOTT, B.D., *Fellow of Trinity College, and Professor of Biblical Greek in the University of Dublin.* With two Plates of Facsimiles. 21s.

**The Parabola, Ellipse, and Hyperbola, treated Geometrically.** By ROBERT WILLIAM GRIFFIN, A.M., LL.D., *Ex-Scholar, Trinity College, Dublin.* 6s.

**An Introduction to Logic.** By WILLIAM HENRY STANLEY MONCK, M.A. *Professor of Moral Philosophy in the University of Dublin.* 5s.

**Essays in Political and Moral Philosophy.** By T. E. CLIFFE LESLIE, Hon. LL.D., DuBL., of Lincoln's Inn, Barrister-at-Law, late Examiner in Political Economy in the University of London, *Professor of Jurisprudence and Political Economy in the Queen's University.* 10s. 6d.
